                                                                              Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Target DNA corresponding to HIV-2 gag region is detected using a capture probe (see AAQ20636) fixed passively to a solid hydrophobic support together with this detection probe labelled with a non-radioactive marker. The capture and detection probes are able to hybridise to non-overlapping segments of the target sequence. See AAQ20389-Q20420 and AAQ20633.

                                                                                                                                                                                                                                                                                       The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour receptor (KDR) and/or feetal liver kinase 1 (flk-1) (e.g. tumour be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vascular endothelial growth factor receptor; VBGF receptor; flt-1; flt-1; XDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vacular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. ARK67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Maize; corn; Zea mays; delta-9 desaturase; GBSS; target; substrate; granule bound starch synthase; hammerhead ribozyme; hairpin ribozyme; modulation; gene expression; transgenic plant; cleavage; cancla plant; caffeine synthesis; coffee plant; nicotine production; tobacco; fruit ripening; flower pigmentation; lignin production; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes an enzymatic nucleic acid molecule ({	t I})

gene. Also described is a grown modulate and expression of a plant Delta-9 desaturase. (1) can be used to modulate expression of a gene, preferably belta-9 desaturase or a granule bound starch synthase (GBSS) gene, in a plant (preferably a maize or canola plant). (1) can be used to modulate caffeine synthesis in a coffee plant, nicotine production in plum or peach plant, fruit ripening processes in an apple, tomato, pear, chrysanthemum or marigold plant or lignin production in a rose, perunia, aspen, poplar or pine plant or lignin production in a tobacco,
with RNA cleaving activity, which modulates the expression of a plant

expression and/or Novel ribozymes for modulating the synthesis, expresstability of an mRNA encoding an angiogenic factors

Claim 54; Page 254; 305pp; English.

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene, AAAL755 to AAA17167 and AAA1751 to AAA17622 represent ribozyme sequences for ARNT, corresponding target sequences; AAA17623 to AAA18385 and AAA1957 to AAA18454 represent their AAA19154 represent ribozyme sequences for Tie-2, and AAA1838 to AAA19086 and AAA19155 to AAA19222 represent their corresponding target sequences for Tie-2, and AAA1838 to AAA19086 AAA19223 to AAA19255 to AAA18386 to AAA19086 AAA19223 to AAA19255 represent ribozyme sequences;

                AAA21596 to AAA21688 represent their corresponding target sequences;
AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequence
for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to
                                                                                                  ŏţ
                                                                               AAA23422 represent there s, and remearly to contracted, nethering the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARND), inflammation, and arthritis, as well as encovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stabins, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin -

Claim 37; Page 90; 164pp; English.

molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATH Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor The present invention relates to enzymatic and antisense nucleic acid protein and interferon alpha.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor protein and interferon alpha.

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRR-2 and/or the CAMTH Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oestrogen receptor hammerhead ribozyme target sequence SEQ ID NO:1678.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Oestrogen receptor; c-raf; k-ras; bcl-2; ribozyme; cleavage; hammerhead ribozyme; halrpin ribozyme; antisense oligonucleotide; gene expression modification; cancer; phosphorothicate; endonuclease; anticancer; breast cancer; endometrium cancer; ss.

nucleic acids that interact, and optionally cleave, target sequences, used to treat cancer

Claim 77; Page 71; 148pp; English.

with a target sequence and contain a tleast one phosphoro(di)thioate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or receptor gene, are used to treat cancer (particularly of breast or receptor gene, are used to treat conditions associated with levels of reated cells, or for other conditions associated with levels of cestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with cargets, and as research reagens (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor corresponding target sequences, and AAA26105 represent their corresponding target sequences. AAA25933 to AAA25107 to AAA2511 represent cetter their ribozyme sequences. AAAA2619 to AAA2511 represent corresponding target sequences, and AAA2619 to AAA26101 represent corresponding target sequences. AAAA2619 to AAA26101 represent corresponding target sequences. AAAA2619 to AAA2611 represent corresponding target sequences. AAAA2619 to AAA2611 represent corresponding target sequences. AAAA2619 to AAA2611 represent corresponding target sequences. AAAA2619 to AAA36271 represent corresponding target sequences and antisense oligonucleotides used in the The present invention describes nucleic acids (A) that interact stably exemplification of the present invention.

New nucleic acids that interact, and optionally cleave, target sequences, used to treat cancer

Claim 77; Page 79; 148pp; English.

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thicate link, having endomuclases activity. (A), and more generally any catalytic nucleic acid (A) that modulates expression of the cestrogen catalytic nucleic acid (A) that modulates expression of the cestrogen receptor gene, are used to treat cancer (particularly of breast or condencatium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of cestrogen receptor. Because of the high selectivity for targeted RNA, (A) alterations in phenotype, particularly for identification with alterations in phenotype, particularly for identification of therapeutic restriction endouncleases are used with DNA). The combination of conditications in (A) improves resistance to nucleases, binding affinity conditions in (A) improves resistance to nucleases, binding affinity corresponding target sequences, and AAA25992 represent their corresponding target sequences, and AAA26105 represent cettogen receptor hairpin ribozyme sequences, and AAA26105 represent chheir corresponding target sequences, and AAA26107 to AAA2618 represent chheir corresponding target sequences, and AAA26107 to AAA2618 represent chheir corresponding target sequences, and AAA26107 to AAA2618 represent chheir corresponding target sequences. AAA26219 to AAA2618 represent chheir corresponding target sequences. AAA26201 to AAA2618 represent chheir corresponding target sequences. AAAA26107 to AAA2618 represent chheir corresponding target sequences. ribozyme sequences and antisense oligonucleotides used in the exemplification of the present invention.

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate link, having endounclease activity. (A), and more generally any catalytic nucleic acid (A), that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or canderium), in vivo or by transforming cells as vivo and implanting treated cells, or for other conditions associated with levels of centrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with cargets, and as research reagents (for RNA, in the same way that treated; and as research reagents (for RNA, in the same way that created; and as research reagents for identification of therapeutic restriction endonucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23501 to AAA2747 represent oestrogen receptor corresponding target sequences, and AAA26107 to AAA26218 represent certor that incorresponding target sequences, and AAA26107 to AAA26118 represent of their corresponding target sequences, AAA26191 to AAA26118 represent of their corresponding target sequences, AAA26191 to AAA26118 represent of their corresponding target sequences, AAA26191 to AAA26118 represent of their corresponding target sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   other ribozyme sequences and antisense oligonucleotides used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 17 BP; 1 A; 0 C; 1 G; 15 T; 0 other;

Oligonuclectide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification -

Claim 7; Page 103; 294pp; English.

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, certinoblastoma. BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A, (CMKN2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, DP-glucoronosyltransferase (UGT1), amyloid precursor protein (APC), presentlin-1 (PSBN1) and presentlin-2 (PSBN2). These can be used in the gene therapy of diseases cuch as cancer, adenosine deaminase deficiency, cystic fibrosis, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and althous syndromes. The present sequence is one of the gene correcting oligonucleotides of the

Isolated porcine reproductive and respiratory syndrome virus useful for production of antibodies, comprises RNA polynucleotide with specified

Disclosure, Page 28; 74pp; English

The invention relates to an isolated porcine reproductive and respiratory syndrome virus (PRRSV) (deposited with ATCC, not stated) or comprising an RNA polynucleotide from PRRSV and the polypeptides encoded by it.

C. An antibody that binds to a Buropean-like PRRSV is useful for detecting a natibody that binds to a European-like PRRSV is useful for detecting a caribody under conditions to form a complex with a virus particle, and detecting the complex, where the presence of the complex indicates the presence of PRRSV, or by providing a biological sample from a porcine subject, adding the antibody to the sample under conditions to form a complex with a virus particle in the sample under conditions to form a complex with a virus particle in the sample and detecting the complex, where the presence of the complex indicates the presence of PRRSV.

C. The virus particle is obtained from a biological sample comprising lung attenuated PRRSV or a PRRSV polypeptide is useful for treating a porcine subject at risk of infection with a PRRSV or displaying symptoms of a tremusted PRRSV or a PRRSV polypeptide is useful for treating to the animal, where the antibody an enutralising an entibody. The virus, polymucleotide or protein is useful for producing the antibodies.

C. The present sequence is a PCR primer used to distinguish between constitution of the present sequence is a PCR primer used to distinguish between companiants.

Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers

```
The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chkl) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chkl levels, including cancer. The present sequence is an oligonucleotide described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oligonucleotide hybridisation potential related cDNA SEQ ID NO: 111.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid hybridisation, probe, primer, human, rabbit, HIV-1, disease diagnosis, ss.

```
The present invention describes a method for predicting the potential of an oligonucleotide to hybridise to a (complementary) target nucleotide sequence, involving identifying a subset of oligonucleotides within the predetermined number of unique oligonucleotides based on the evaluation of the parameter. Oligonucleotides in the subset are identified that are clustered along a region of the nucleotide sequence that is hybridisable to the target nucleotide sequence. This is useful for evaluating
                                                                                                                                                                                                      Predicting the potential of an oligonuclectide to hybridize to a target nuclectide sequence, useful for evaluating oligonuclectide probe sequences, by identifying a oligonuclectides based on the evaluation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        oligonuclectide probe sequences. The present sequence is an oligonuclectide described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match 1.3%; Score 13.8; DB 1; Length 17; Best Local Similarity 88.2%; Pred. Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury -

Claim 88; Page 134; 200pp; English

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down control of a neurite growth inhibitor gene (NOCO).

The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NNA molecule cotif) pr an amberzyme (cleaving RNA with an NGN triplet), a zinzyme cotif pr an amberzyme (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^27+. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the cuse of one or more therapies. In particular, the CD20 targetting conclet acid may be used to treat lymphoma, leukaemia, B-cell collicular NHL, lymphocytic leukaemia, HIV (human low-grade or follicular NHL, lymphocytic leukaemia, HIV (human)

```
immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunodeficiency virus) small B-cell lymphocytic lymphoma, immune thrombon, immune cortromania, and inflammatory arthropathy. The NGGO-targetting nucleic acid is used to cleave RNA of the NGGO gene in the presence of a divalent cation that is preferably Mg^2+. Furthermore, the nucleic acid divalent cation that is preferably Mg^2+. Furthermore, the nucleic acid may be contacted with a cell to reduce NGGO activity of the cell and treat a patient having a condition associated with the level of NGGO. The treat a patient having a condition associated with the level of NGGO. The creat a patient having a condition associated with the level of NGGO. The creat a patient any further comprise the use of one or more therapies.

In particular, the NGGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzheimer's disease, dementia, multiple sclerosis (ALS), parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NGGO expression. The present sequence is an amberzyme molecule of the invention.

New isolated nucleic acid encoding an isoform of human pregnancy associated plasma protein E, for preventing or aborting pregnancy

Example 2; Page 138; 353pp; English.

щ This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein in hPAPP-E. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the

```
ö
antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorinoir villus samples, to diagnose dysgenetic pregnancies anternatally. This sequence represents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention.

Single Primer Amplification, nested oligonucleotide extension reaction, hairpin; SPA; library; PCR; primer; ss. using the Maruyama T; Amplifying nucleic acid by synthesizing template nucleic acid containing a predetermined sequence and hairpin structure and usi template for target amplification by Single Primer Amplification Human IgM heavy chain gene related PCR primer SEQ ID No 52. Mcwhirter J, Lin Y, Barbas-frederickson S, 10-DEC-2001; 2001WO-US47727. 11-DEC-2000; 2000US-254669P. (ALEX-) ALEXION PHARM INC. WPI; 2002-500537/53. WO200248401-A2. Homo sapiens Bowdish KS, 20-JUN-2002

The invention relates to a method for amplifying a nucleic acid using Single Primer Amplification (SPA). The method comprises synthesising a template mucleic acid containing a predetermined sequence and hairpin structure with the nested oligomolectide extension reaction. The method is useful for amplifying a nucleic acid, preferably for amplifying a family of related nucleic acid sequences. The engineered nucleic acid strand by providing a nucleic sold sequence on please and a hairpin is useful for amplifying a nucleic acid strand by providing a nucleic acid strand sequence complementary to the predetermined sequence and a hairpin structure between them and contacting the engineered nucleic acid strand sequence. This process is done in the presence of a polymerse and nucleotides under containing at least a portion of the prodetermined complementary nucleic acid strand. The method of the invention is useful for producing large amounts of a target nucleic acid sequence and for amplifying simultaneously more than one different target nucleic acid condicions amplifying sequence represents a PCR primer of the invention. ionisation, as therapeutic supplement in patients having specific deficiency in hBOMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hBOMLP-1 may be used for diagnosing a disorder associated with the expression of hBDMLP-1, in particular heart and skeletal muscle disorders. hBDMLP-1 is localised to chromosome 2. The present sequence represents an oligomer used in the screening of the hBDMLP-1 sequence in the exemplification of the present
                                                                                                                  N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart, muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

Disclosure; SEQ ID 8381; 214pp; English.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 mucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification of hGDMLP-1 provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption

New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1

Disclosure; SEQ ID 8654; 214pp; English.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 mucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification conspirates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption concentration, as therapeutic supplement in patients having specific displacement the plynucleotide sequences encoding hGDMLP-1 may be used for therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. HGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence.

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after consecutive nucleotides from the 17 mer sequence, as sequence with, after continual alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a mucleic acid, ce.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, colypeptides, vectors containing the nucleic acids, colypeptides, vectors containing the nucleic acids, colypeptides, vectors containing the nucleic acids, colypeptides directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of vixal diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell diseases that any specifically cancer but also Alzheimer's disease and spatient samples is useful for diagnosis and/or prognosis of these patient samples is useful for diagnosis and/or prognosis of these cher the polypeptides can also be used to generate antibodies, and chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression characterial human fukutin oligonucleotide of the invention.
                                                                                                                                                     Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABES9889 - ABEZ6516, ABEZ6521, ABEZ6522, and AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel short interfering RNA (siRNA) nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

This primer is used for the PCR amplification of an exon of the human calcium ion channel alpha 1 subunit. The channel is related to familial calcium ion channel alpha 1 subunit. The channel is related to familial corresponding migraine (FHM) and/or episodic ataxia type 2 (EA-2) and is derived from, related to or associated with a gene present in humans on chromosome 19p13.1-13.2. The encoding nucleic acid can be used to containe or identify genes related to episodic neurological disorders, specifically migraine, FHM or EA-2, but also epilepsy. It can also be used to distinguish between alleles of the corresponding gene. Calls and caid can be useful in study, development and treatment of migraine, FHM, acid can be useful in study, development and treatment of migraine, FHM, can attral or synthetic antibodies against the proteins can be used to diagnose FHM, EA-2, migraine and other neurological conditions associated with cation channel disfunction.
- useful for diagnosis and development of specific treatments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 18 BP; 4 A; 4 C; 6 G; 4 T; 0 other;

Identifying compounds which modulate expression of nucleic acids, us to provide compounds having defined physical, chemical or bioactive properties, e.g. antisense activity -WPI; 1999-620446/53.

A method has been developed of defining a set of compounds that modulate the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a Example 24; Page 105; 264pp; English.

library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tax according to defined criteria. Also described are: (1) a method of defining a set of oligonuclectides (ONE) that modulate the expression of a tNR acquence via binding of the ONE with the tNR sequence comprising generating a library of virtual compounds in silico according to defined criteria; and evaluating in silico the binding of the compromes via binding of the compounds with the tNR. The method of defining a set of compounds that modulate the expression of a tNR sequence via binding of the compounds with the tNR. The methods can be used for the generation and identification of synthetic compounds having defined physical, chemical or bioactive properties. Information gathered from assays of such compounds is used to identify mucleic acid sequences that are tractable to a variety of nucleotide sequence-based technologies, e.g. antisense drug discovery and target validation. AAZ40852 to AAZ41220, and AAY52701 to AAX52706, represent sequences used in the exemplification of the present invention. 8X355555555555555555555

```
nucleic acid molecule encoding human ELK-1 (also known as p62TCE). ELK-1 is a member of the ternary complex factor subfamily of Ets-domain transcription factor proteins. The polynucleotides inhibit the expression of human ELK-1, and this sequence targets the 3' untranslated expression of human ELK-1, and this sequence targets the 3' untranslated region of the ELK-1 RNA. Sequences AAZ06571-Z06607 all cause at least 30% credion of the ELK-1 RNA. Sequences AAZ06571-Z06607 all cause at least 30% inhibit the expression of human ELK-1 in human cells or tissues in vitro inhibit the expression of human ELK-1 in human cells or tissues in vitro. ELK-1 uses a bipartite recognition mechanism mediated by both protein-DNA control protein-protein interactions to regulate genes by direct and indirect on babindary and other cell functions including apoptosis. This means that cartismase compounds inhibiting expression of ELK-1 can be used to treat and to prevent or delay infection, inflammation or tumour formation. The compounds can also be used for diagnosis, as research reagents and in
Antisense compound useful for diagnosis, treatment and prevention of disease associated with BLK-1 expression

Novel analytical method designated Fine Array Transcript Mapping, useful for detecting and measuring RNA molecules transcribed from genome, differential expression, and sequence mapping -

Example 1; Page 16; 53pp; English.

This sequence represents a reverse PCR primer targeted at the VP16 gene of herpes simplex virus type 2 (HSV-2) SB5 (ATCC VR 2546). It was used for semi-quantitative PCR analysis of SB5 cDNA. PCR

0 using the VP16 primer pair generated a 192 bp product, and allowed detection of 1 HSV copy from 45 cycles (or 100 copies from 35 cycles). The invention provides a novel genetic analysis method termed Fine Array Transcript Mapping (FAT Mapping) for detecting and measuring RNA molecules transcribed from a genome, differential expression, and mapping of the 5' sequence of a transcript. FAT mapping involves probing a test grid containing an array of 100s of overlapping genomic clones or DNA fragments with probes consisting of labeled cDNAs representing the RNA transcripts from test populations. The system allows quantitative measurements of the expression of rare transcribts, and enables the analysis of method can be used to measure the differential expression of measure the differential expression of method can be used to measure the differential expression of Gaps transcripts between 2 or more different viral, tissue or cell populations which share a common genomic sequence, or to determine whether a particular open reading frame is expressed under certain conditions. The FATMap technique has been applied to the HSV-2 . 0 Query Match

                                                                                                                ö
is used in an assay to evaluate the activity of a FEN endonuclease. This sequence is the fragment of Heltest4 which is cleaved off by FEN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to DNA for a promoter and an L1 cassette sequence having a core retrotransposon element. The invention is useful for random insertion of a heterologous or homologous DNA sequence into a cell genome, and for correction of a genetic defect in the cell into which the insertion is made. Genetic defects which may be corrected includes cystic fibrosis, mutations in the dystrophin gene, genetic defects associated with blood clotting and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNAc comprising a promoter P and an L1 cassette sequence having a core retrotransposon element, useful for random insertion of a heterologous or homologous DNA sequence into a cell genome and for correcting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

```

```
The invention relates to isolated genes (Gene 216) from human chromosome 20213-pi2 and the proteins they encode. The nucleic acids and proteins may be used in the prevention, diagnosis and treatment of diseases corrected with inappropriate Gene 216 expression. For example, the nucleic acids (or vectors) and proteins may be used to treat disorders concluded with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of gene 216 by expressing inactive proteins or to supplement the patients own production of Gene inactive proteins or to supplement the patients own production of Gene 216 protein, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. The nucleic acids into a host cell and culturing the cell to express the protein. The nucleic acids and complementary sequences may also be used as probas in diagnostic assays to detect and quantitate the presence of similar nucleic acids crestorative therapy. The Gene 216 protein may also be used as antigens in the production of antibodies against Gene 216 similar nucleic acid antibodies and antagonists may also be used to down regulate expression and activity. The anti-Gene 216 continuous for detecting the presence of Gene 216 expression and activity. The anti-Gene 216 continuous for detecting the presence of Gene 216 proteins in samples (e.g. by enzyme linked immunosorbant assay or ELISA). Disorders that may be continuous orbant assays or ELISA). Disorders that may be continued, for agents of the dene 216 retained by the above methods include, for example asthma, obesity and inflammatory bowel disease. The present continuous in the physical mapping of the gene continuous that of a Gene 216 retained primer used in the physical mapping of the gene continuous continuous and activity in the physical mapping of the gene continuous and activity and inflammatory bowel disease. The present continuous is that of a Gene 216 retained by any and activity and proteins in a second and or act
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô

The present sequence represents the cleavage product of an oligonucletide used to test FEN nuclease activity. FEN nucleases are used in the course of the invention. The specification describes a method for generating a signal indicative of the presence of a target nucleic acid sequence in a sample. The method comprises forming a cleavage structure comprising duplex and single-stranded nucleic acid, by incubating the target nucleic acid sequence, with a probe having a secondary structure that changes upon binding of the probe to the target nucleic acid sequence, and cleaving the cleavable structure with a nuclease to release a nucleic acid fragment. The method is useful for generating a signal indicative of the presence of target nucleic acid sequence in a sample. It is useful in a polymerase chain reaction (PCR)-based assay or non-PCR based assay for detecting naturally occurring target nucleic acid sequences in a solution including RNA and DNA that is isolated and purified from cells, tissues, single cell organisms, bacteria or viruses, and for detecting synthetic targets in solution, including RNA or DNA or DN 0; Gaps . 0 Query Match 1.3%; Score 13.8; DB 1; Length 18; Best Local Similarity 88.2%; Pred. Detecting/measuring target nucleic acid, by forming cleavage structure by incubating target nucleic acid with probe having binding moiety, cleaving structure to release nucleic acid and detecting released

Disclosure; Page 38; 157pp; English.

This invention relates to a novel method for detecting/measuring a target nucleic acid. The method comprises forming a cleavage structure target nucleic acid. The method comprises forming a cleavage structure by incubating the target sequence with a probe comprising a binding of the probe as secondary structure that changes upon binding of the probe to the target, cleaving the cleavage structure to release a nucleic acid fragment, and detecting and/or measuring the fragment captured by binding of the binding moiery to a capture element on a solid support. The method of the invention is useful for generating a signal indicative of the presence of the target nucleic acid in a sample. Another method of the presence of the target nucleic acid in a sample and cleavage structure, amplifying the target nucleic acid in a sample and cleavage structure, amplification process, and allows for concurrent amplification and allows for concurrent amplification and cleavage product generated by FEN 1 nuclease shown are represented a cleavage product generated by FEN 1 nuclease shown

```
The present sequence is the 18-nucleotide cleavage product of FEN nuclease template 1 oligonucleotide, Heltest4 (see AB154126), which was used in a method for determining FEN endonuclease activity. Heltest4 binds to M13 to produce a complementary double-stranded domain and a non-complementary 5 overhang. This duplex forms cemplate 2. Template 3 has an additional primer, FENAS (see AB154127), bound to M13 and is directly adjacent to Heltest4. In AB154127), bound to M13 and is directly adjacent to Heltest4. In the presence of template 3, FENAS binds the free 5 terminus of the presence of the junction and cleaves Heltest4 to produce the present 18-nucleotide fragment. FEN nuclease is preferred for use in the method of the invention, which relates to generating a signal to detect the presence of a target nucleic acid in a sample. In this method, a nucleic acid is treated with a probe that has a secondary structure which changes upon binding of the probe to a target nucleic acid sequence, and a nuclease. The invention also provides a process for detecting or measuring a nucleic acid that allows for concurrent amplification, cleavage and detection of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             target nucleic acid sequence in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0

Probes for detecting target nucleotide sequence in sample, has sequence that forms hairpin structure having a double-stranded segment and single-stranded loop collectively forming region complementary to target sequence

Example 4; Page 49; 72pp; English.

The present sequence is that of DNA-RNA-DNA hybrid oligomucleotides (See AGT02013. This is one of a set of oligomucleotides (See AGT02013.) This is one of a set of oligomucleotides (See AGT02013.) Used to assess the minimum number of ribonucleotides in DNA-RNA chimeric oligomucleotides required for RNase H cleavage. Each oligomucleotides required for RNase H cleavage. In DNA-RNA chimeric oligomucleotides adifferent number of ribonucleotides. In the oligomucleotides were mixed with target DNA oligomucleotide AGT02009 (See ABA9151) and incubated with RNase H (5 U/ml) at 37 degrees C for 30 minutes. The results showed that 4 ribonucleotides were the minimum number of for RNA cleavage. The invention provides probes for nucleic acid of hybridisation. The probes form a hairpin structure comprising a double-stranded stem and a single-stranded loop, and are capable of both intramolecular and intermolecular hybridisation. The both intramolecular and intermolecular hybridisation. The chouble-stranded stem may comprise a methylphosphonate DNA-RNA hybrid ses that is resistant to RNase H cleavage. When the probe hybridises that is resistant to RNase H cleavage. Mhen the probe hybridises with a target DNA, the RNA strand in the DNA-RNA duplex becomes the methods for nucleic acid hybridisation using the probes are provided.

New nucleic acid molecule comprising a sequence of an allele of a polymorphic bovine acyl CoA-diacylglycerol transferase gene useful for testing a mammal for its predisposition for fat content of milk and for meat marbling

Example 1; Page 35; 91pp; English.

The present invention describes a nucleic acid molecule (NA) (I) encoding a bovine acyl CoA-diacylglycerol transferase (DGAT) contributing to or indicative for low fact content of milk and to low meat marbling to or (intramuscular fat content). Human DGAT is located to chromosome 8, and chromosome 14. (I) is useful for testing a mammal for its predisposition for fat content of fullk and/or its content of milk and/or its predisposition for meat marbling. The method comprises analysing the predisposition for mear polymorphisms (SNPs) which are connected with the predisposition. The polymorphisms sre located in the coding region of the DGAT gene and result in substitution, deletion and/or addition of an amino acid sequence of the polymorphisms are located in the coding region of the DGAT gene and result in substitution, deletion and/or addition of an amino acid sequence of the polymorphism are located in the coded by the gene. The acid sequence of the polymorphism is encoded by the gene. The guanine, 11030 a guanine, 11048 a cytosine or thymine and a cytosine residue, at position 3343 a cytosine or cytosine which correlate with a predisposition for low fat content of milk and low meat marbling. The nucleic acid molecule has at the position corresponding to position 10433 and 10434 of the DGAT gene two adenine residence which meat marbling the nucleic acid molecule has at the position and high meat marbling the nucleic acid molecule has a the position and high meat marbling the nucleic acid molecule has a the position and high meat marbling the nucleic acid molecule has a the position and high meat marbling the nucleic acid molecule has a the position and high meat marbling the nucleic acid molecule has a the position and high meat marbling the nucleic acid molecule has a the position and high meat marbling the nucleic acid molecule has a the position and high meat marbling the nucleic acid molecule has a the position and high meat marbling the nucleic acid molecule has a the position and high meat marbling the nuc and high meat marbling. The nucleotide polymorphisms are located in a region which is responsible for the regulation of the expression of the product of the gene encoding DGAT. ABZ76924 to ABZ77045 and ABP96035 to ABP96046 represent sequences used in the exemplification of the present

Winter A; Fries H, WPI; 2003-239205/23

New nucleic acid molecule comprising a sequence of an allele of a polymorphic bovine acyl CoA-diacylglycerol transferase gene useful for testing a mammal for its predisposition for fat content of milk and for meat marbling -

Example 1; Page 36; 91pp; English.

The present invention describes a nucleic acid molecule (NA) (I) encoding to a bovine acyl CoA-diacylglycerol transferase (DGAT) contributing to or indicative for low fat content of milk and to low meat marbling (intramuscular fat content). Human DGAT is located to chromosome 8, and (bovine DGAT is located to chromosome 8, and content of milk and/or its mand for its predisposition for fat content of milk and/or its mand for its predisposition for meat marbling. The method comprises analysing the compensation for meat marbling. The method comprises analysing the collymorphisms (SNPs) which are connected with the predisposition. The polymorphisms are located in the coding region of the DGAT gene and result in substitution, deletion and/or addition of an amino acid sequence of the polypeptide which is encoded by the gene. The nucleic acid molecule has at the position 10433 and 10434 of the DGAT gene a quanine and a cytosine or thymine and 11033 a cytosine or cytosine or thymine and 11033 a cytosine or thymine and lond correlate with a predisposition for low fat content of milk and low meat marbling. The nucleic acid molecule has at the position corresponding to position 10433 and 10434 of the DGAT gene two adenine corresponding to position 10433 and 10434 of the DGAT gene two adenine cresidues which correlate with a predisposition for high content of milk and low meat marbling. The nucleic acid molecule has at the position corresponding to position 10433 and 10434 of the DGAT gene two adenine cresidues which is responsible for the regulation of the expression of the product of the gene encoding DGAT. identified from human chromosome 20p13-p12. The invention also discloses regions of the 216 gene that contain single nucleotide polymorphisms (SNP's) which may be used as markers for disease susceptibility or severity. The nucleotides of the invention may have antiathmatic, antiinflammatory or anorectic activities and may be used in gene therapy. The nucleic acids, antibodies or its fragments are useful for diagnosing, preventing or treating a disorder, such as respiratory diseases (e.g. asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary disease or adult respiratory distress syndrome), obstructive pulmonary disease or adult respiratory distress syndrome), useful for identifying increased susceptibility of a subject to the disorders mentioned. The nucleic acids can also useful for the recombinant production of disorder-associated peptides or polypeptides, for chromosome and gene mapping, or for tissue distribution studies. The present sequence represents a gene to specific PCR primer used in the scope of the invention.
                                                                                                                                                                                                                                         New isolated gene 216 nucleic acids, useful for diagnosing, preventing or treating a disorder, such as asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary disease, obesity or inflammatory bowel

Residues 13 and 14 are linked via an o-xyloso group (i.e. moleotides that have xylose sugar linked via the o-xylene ring). The sequence is designed to target the Human interleukin-1 beta gene beginning at moleotide 7378 and will covalently cross-link to it via the N4N4-ethanocytosine group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               deoxyribonucleic acid; major groove; ethanoamino group; IL-1; aziridinylcytosine; cross-linking group; o-xyloso linking group; human interleukin-1 beta; inverted polarity region; ss.

Residues 13 and 14 are linked via an o-xyloso group (i.e. nucleotides that have xylose sugar linked via the o-xylene ring). The sequence is designed to target the Human interleukin.1 beta gene beginning at nucleotide 7378 and will covalently cross-link to it via the N4N4-ethanocytosine groups.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       bind to the major groove of duplex DNA and are esp. useful for treating latent infections e.g. HIV

The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence the this oligomer is the human interleukin -1 beta gene beginning at nucleotide 7378 conts. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV; HER; HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to
 Oligomer HUM beta 114 for forming triplex with IL-1 target duplex.
 Human interleukin - 1 beta gene; herpes simplex; AIDS; modified;
HIV; RSV; HPV; malignancy; hepatitis; inflammation; ss.
 New oligomers contg. modified bases - which form a triplex with G-C doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis, herpes, malignancy and inflammation

harsh conditions. The oligomer contains an inverted polarity region formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso (mucleotides have the 3' positions of xylose sugars linked via the o-xylene ring). Two nucleotides are coupled through a xylene residue to form the dimer synthon. This additional modifications may render the oligomer stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also AAQ25452-25501 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.)

ó
 The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The primers AAT65798-T66047 were used to PCR amplify the inserts from the isolated clones containing the repeat sequences. The primers AAT65904-5 were used to amplify the repeat sequence marker clone Mid54.

The present invention describes the rat Nurrl coding and protein sequences. The Nurrl protein is involved in the induction of tyrosine hydroxylase expression in adult rat-derived hippocampal progenitor cells. The Nurrl gene and protein can be used in the treatment of catecholamine-related diseases such as Parkinson's disease, manic depression and schizophrenia. They can also be used to induce tyrosine hydroxylase expression and identify tyrosine hydroxylase expression and identify tyrosine hydroxylase related deficiencies, which are linked to the same diseases. The present sequence is a PCR primer used in a method to differentiate adult neural progenitor

 The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA86415 to AAA86787. The ribozyme recognition is useful for inhibiting restenosis by introduction of the ribozyme into cells.

The ribozyme is resistant to endonuclease activity and hence is

 sporadic basal cell carcinoma (BCC) in an animal. The method involves measuring the level of Gili in a sample of skin. Gili levels above basal or normal indicate the presence or onset of sporadic basal cell carcinoma. Gili is a zinc finger transcription factor down stream of secreted sonic hedgehog (shh) activation in a cascade of cytoplasmic signal transduction. Gili in turn can induce Shh expression in an auto regulatory manner. There are links between ectopic expression of the Gili gene and the development or onset of BCC. The method is useful for particularly in detecting skin cancer. The present sequence represents a per primer specific for human Shh cDNA. The primer is used in the method

Treating proliferative skin or eye diseases and scarring, using

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (WMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding [1]. (I) can have antipsoriatic, ophthalmological, cytostatic, antiseborrheic, antidiabetic, antisickling, dermatological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding Gytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriatis, atopic dermaticis, actinic keratosis, skin diseases such as psoriatis, atopic dermaticis, actinic keratosis, also be used for treating proliferative eye diseases such as diabetic also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing securiting such as keloid, adhesion and hypertrophic or hypertrophic burn eventification of the avamentification of the avamentification of the avamentification of the account of the avamentification of the available of the available of the available of the avamentification of the available ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent exemplification of the present invention. nucleic acid molecule useful for cloning and expressing a pollen specific sequence in a plant Novel

Example 1; Page 32; 66pp; English.

The invention relates to regulatory elements (AAF76059-AAF76067) from

the maize MADS box gene ZmWADS2 (AAF76068) which are capable of directing expression in a pollen-specific manner. The ZmWADS2 protein (AAB73333) is expressed particularly in mature pollen after dehiscence, indicating that it has an essential role in pollen development and function, in particular in pollen tube growth. The invention also relates to vectors and host cells comprising the ZmWADS2 regulatory or genomic sequence, and their use in the generation of transgenic plants. The ZmWADS2 regulatory cequences are useful for cloning and expressing a pollen-specific or pollen-abundant gene in a plant, and may also be used to drive the pollen-abundant gene in a plant, and may also be used to drive the manner. The ZmWADS2 regulatory sequences are useful for isolating related regulatory sequences are useful for isolating related repulatory sequences are useful in plant breach operably linked to them. The regulatory sequences are useful in plant breach operably for the production of hybrid seed in particular, they mading, especially for the pollen-specific sequences are useful in plant breeding, especially for the production of hybrid seed. In particular, they may be used to drive the pollen-specific expression of heterologous genes which confer nuclear or cytoplasmic male sterility in transgenic plants (e.g., cereals). Sequences AAF76081sterility in transgenic plants (e.g., cereals). Sequences AAF76081-AAF76084 represent PCR primers used in the isolation of cDNA encoding ZmMADS2 (AAF76058)

Novel nucleic acid molecule, ZmMADS2 derived from pollen of Zea mays useful for cloning and expressing a pollen specific sequence in a plant and for producing male sterile plants

Example 1; Page 74; 76pp; English.

The present invention provides the protein and coding sequences of the Zea mays ZmWADS2 protein, which is specifically expressed in pollen. The sequences can be used to produce male sterile plants, as ZmWADS2 is essential for pollen tube growth. These are useful in hybrid breeding, particularly of corn, cereal and grain. The present sequence is a PCR primer for the ZmWADS2 coding sequence.

 The present invention describes an isolated nucleic acid molecule (I), which encodes a polypeptide (II) required for the viability and/or growth and/or production of mematodes (Caenorabditis elegans), or its and/or reproduction of nematodes (Caenorabditis elegans), or its fragment. (I) and (II) have nematodide and plant protectant activities. Tragment (II) have nematodide and plant protectant activities. I required for the viability, growth and/or reproduction of nematodes.

Nucleic acids, probes, polypeptides, fusion proteins and antibodies from the present invention are also useful in a screening assay for the present invention are also useful in a screening assay for the present invention are also useful in a creening assay for the present invention. They are useful for diagnosing or treating human or animal diseases associated with the infection or presence of nematode worms, e.g. Wucheria bacroffi, Brugia malay, Loa loa or Onchocerca volvulus. These diseases include calabar swellings, lymphatic filariasis (elephantiasis) or onchocercoma. The nucleic acids, probes, clagnosing or treating plant diseases associated with the infection or presence of nematode worms. Purthermore, the nucleic acid and amino concludes are useful for developing computational models, structural models or other models for evaluating drug binding and efficacy. The present sequence represents a primer which is used in an example from the present invention in RNAi experiments.

 The present invention provides the gene, protein and cDNA sequences of the human endothelial differentiation, G-protein coupled receptor 6 (EDG6). Also identified are single nucleotide polymorphisms (SNPs) found within the sequences. The sequences can be used in the identification of the haplotype of an individual, and in the treatment of cancer, angiogenesis and inflammation. The present sequence is an allele specific primer for the EDG6 gene, which is found on chromosome 19p13.3.

A mixture of oligonucleotides (AAT86601-3) were separated by a new process using capillary affinity gel electrophoresis. The invention relates to selective separation of electrically charged target molecules in an analytical mixture. It comprises capillary affinity gel electrophoresis using a capillary tube which is at least partly filled with a polymer gel. Receptors for target molecules are covalently bound to the polymer. An electric field of at least 50 volts/cm is applied. The capillary tube is charged with the analytical mixture. In a first separation stage, the target molecules in the mixture are bound to the receptors and the remaining components are eluted, optionally whilst optionally misses, so that the affinity of the target molecules for the receptor is eliminated and the target molecules are eluted and detected, optionally whilst splitting open. The process is useful for selective separation and/or determination of charged organic compounds, come as oligonucleotides, peptides or carbohydrates. It may be used, e.g. for isolation of specific proteins and DNN molecules, purification of antitions and analysis of antisense compounds or screening for enzyme intition which target compounds or screening the same and mixed. inhibitors. The process achieves higher resolution and selectivity than prior art processes, especially in the case of complex biological analytical mixtures. It has high sensitivity, even with small amounts of standles. The derivatised polymers may be synthesised specifically using standard methods. Oligonucleotide separated by capillary affinity gel electrophoresis. A new method useful for diagnosing human adenocarcinoma and measuring metastatic potential comprises determining the levels of macrophage migration inhibitory factor within tumor cells

Claim 11; Column 7-8; 6pp; English.

This invention describes a novel method for diagnosing adenocarcinoma and determining metastatic ability of human cancer in an individual by determining the increased levels of macrophage migration inhibitory factor (MIF) within tumor cells. The method is useful for diagnosing useful for measuring levels of macrophage migration inhibitory factor within tumor cells. The method is useful for diagnosing useful for measuring levels of macrophage migration inhibitory factor within tumor cells. The method provides better and more accurate prognostic markers for cancer. The method is also capable of distinguishing histological tumors from clinical cancers. This sequence represents a primer used to detect the human MIF gene D5k region which is described in the method of the invention.

This invention relates to a polymucleotide sequence that is a polymorphic variant of the human prostaglandin-endoperoxide synthase 2 (PTGS2) gene also referred to as cyclooxygenase 2. The human PTGS2 gene sequence also referred to as cyclooxygenase 2. The human PTGS2 gene sequence AAPB0896 contains 27 single mucleotide polymorphisms (SNPs). AAPB0896 and AAPB0897 represented by AAB12199. The invention includes PCR and sequencing primers, and probes represented in AAPB0898 - AAPB1151 which are used to isolated and characterise the PTGS2 gene sequence, and to coate the positions of the SNPs. PTGS2 proteins and polymucleotide sequences are used to express variant PTGS2 proteins, for structural analysis or thugh studies and also in gene therapy (either cypressing PTGS2 or inhibitory RNA). Antibodies raised against PTGS2 are useful for diagnosis, prognesis and therapy and analysis of the new, and known, polymorphisms and used to determine PTGS2 haplotype and genetype, especially for determining association between a particular trait, e.g. and contains the pTGS2 but also disease contains and contains the pTGS2 but also disease contains and contains the pTGS2 but also disease.
 susceptibility, severity or stage. Anti-PFGS2 antibodies are particularly used for developing diagnostic tests and treatments for immune-related disorders such as arthritis and inflammation. The polymorphisms may also be used to study expression and biological function of PFGS2. Transgenic animals that express PFGS2 are used to study expression of PFGS2 is a second to study expression of pFGS2.

The present invention relates to enzymatic nucleic acids which enzymatic nucleic acid or ribozyme is in a hammerhead (HW). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HVV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with the inconjunction with one or more obtar drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HVV hammerhead (HH) ribozyme.

Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site
 New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma

A triple-helix comprising a double helical nucleic acid (DENA) and an oligonucleotide which binds in parallel and antiparallel orientation, respectively, for targetting sequences on alternate strands of DENA to control gene expression

Example 6; Fig 20A; 108pp; English.

The present invention relates to methods and oligonucleotides for forming a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a sequence within the parallel and antiparallel orientation, respectively, to target couple helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression is regulatory sequences of a target gene. The oligonucleotides can be selected to regulatory sequences within genomic DNA for diagnostic and specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be selected to specifically bind to pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for replication or virulence, reducing their pathogenic bacteria or viruses for replication or oligonucleotides can be chosen to target a unique sequence of the pathogenic and pathogen's host. The oligonucleotides can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or virule-helices with such sequences including those of endogenous or triple-helices with such sequences in cancer capable of forming triple-helices with such sequences in cancer capable of forming triple-helices with such sequences in cancer capable of comming the activated oncogene, so preferentially killing or repressing the cancer casaing cell. The present sequence represents an oligonucleotide

The present sequence is for detecting viable Cryptosporidium parvum cells by hybridising specifically to unique 18S rRNA sequences of cells by hybridising specifically to unique 18S rRNA sequences of problem. It can be used when labelled as a probe or as a primer for pCR amplification of 18S rRNA. It can detect live C. parvum cocysts, or other cells, particularly in water but also in other environmental or clinical samples such as animal or human body fluids or excretions. It does not detect dead cells, because RNA degrades too quickly in such cells, or cells of other Cryptosporidium species that are not pathogenic to humans.
 Oligonucleotide for detection of viable Cryptosporidium parvum cells - hybridises with unique sequences in 18S rRNA, useful as probe or primer for PCR amplification
 Two TEG molecules joined via a phosphate group are attached to the 5' terminus. The cytidine residue at position 15 is attached to the 3' adenosine residue by two TEG molecules which are joined via a phosphate group. The diol-contg. linking group forms phosphodiester bonds with C and A. The resulting oligomucleotide is resistant to exonuclease degradation.

The present sequence is that of a single mismatch target sequence of for a molecular beacon comprising an oligomucleotide probe (see ABL57069) covalently attached at the 3' end to fluorescent dye and at the 5' end to a nanoparticle. In the native state, the probe of forms a hairpin conformation with hybridised termin. The proximity of the fluorophore and quencher (gold nanoparticle) in the molecular beacon results in little or no detectable of the probe to a target sequence, such as the present sequence. Upon hybridisation of the central complementary stretch of the hairpin undergoes a conformational change resulting in an increase in fluorescence, the extent of which is proportional to the amount of target sequence present. Experiments with the present sequence and a perfectly matched target (see ABL57071) showed that hybridisation was very specific to the matched target. The invention relates generally to the use of metal surface quenchers such as particles or films for high sensitivity applications in, for example, detection and diagnostic systems.
 Sensitively detecting proximity changes in a system that utilizes an interacting fluorophore and quencher, for high sensitivity applications, involves utilizing a metal surface as quencher -
 Molecular beacon, fluorophore, nanoparticle, nucleic acid detection,

The present invention describes a composition comprising a mixture of different species of molecules where each species is linked to a tag that is unique to that species and that encodes at least two variable positions on that species and that encodes at least two variable positions on that species and that encodes at least two variable continues that isolating each of the tags prior to identification. Liquid phase hybridisation system may be used for simultaneous identification. Liquid phase hybridisation system may be used for simultaneous identification of a large subset of targets out of a very large collection of similar of dissimilar molecular species. It may also be used to create tagged molecules that identify any collection of molecular species, e.g. peptides, antibodies, nucleic acids. Method bar codes collections or probes or analytes for use in a liquid phase hybridisation method. Tagged probes able to detect small changes or mutations in the target specimen. The concentration of the probe would not be limited by the solid support, both the target nucleic acids and the probes can diffuse toward each coher, and signal amplification through cycling reactions could occur. Sequencing DNA with tags in combination with DNA amplification techniques means that there is no need for traditional sequencing methods or the materials to be analysed or the materials.

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor. EAR3/COUP-TF-1, the GATA transcription factor gene, TRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.

The present invention relates to an oligonucleotide array comprising oligonucleotide tags fixed to a solid substrate. The oligonucleotide array is useful for genotyping a nucleic acid sample at one or more loci via slugle base extension (SBE) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide polymorphism (SNP). The present sequence is one of the primers used in the method of the present invention to amplify a polymorphic sample. The amplification are suppleded in a substantial product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to form the oligonucleotide array.

Landers JE, Jordan B,

Detection of single nucleotide polymorphisms in genomes by preparation and analysis of reduced complexity genomes, useful for genotyping, fingerprinting and determining allele frequency of SNPs

Disclosure; Page 63; 111pp; English.

A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA3594 to AAA35947 represent

Kmiec EB,

Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification -

Claim 7; Page 246; 294pp; English.

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKN2A), APC, Factor V, Factor VII, Factor IX, haemoglobin alpha locus apolipoprotein E (APOE), IDL receptor (IDLR), UDP-glucuronosyltransferase (UGTI), amyloid precursor protein (APC), presenilin-1 (PSBN1) and presenilin-2 (PSBN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia,

haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting

 The present invention describes a method for predicting the potential of an oligonucleotide to hybridise to a (complementary) target nucleotide sequence, involving identifying a subset of oligonucleotides within the predetermined number of unique oligonucleotides based on the evaluation of the parameter. Oligonucleotides in the subset are identified that are clustered along a region of the nucleotide sequence that is hybridisable to the target nucleotide sequence. This is useful for evaluating oligonucleotide probe sequences. The present sequence is an oligonucleotide described in the exemplification of the invention.
 (UGTI), amyloid precursor protein (APC), presentitin-1 (PSENI) and presentitin-2 (PSENI) and presentitin-2 (PSENI). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. Predicting the potential of an oligonucleotide to hybridize to a target nucleotide sequence, useful for evaluating oligonucleotide probe sequences, by identifying a oligonucleotides based on the evaluation of parameters

Example 1; Column 49; 342pp; English.

The present invention describes a method for predicting the potential of an oligonucleotide to hybridise to a (complementary) target nucleotide sequence, involving identifying a subset of oligonucleotides within the predetermined number of unique oligonucleotides based on the evaluation of the parameter. Oligonucleotides in the subset are identified that are ollsteared along a region of the nucleotide sequence that is hybridisable to the target nucleotide sequence. This is useful for evaluating oligonucleotide probe sequences. The present sequence is an oligonucleotide described in the exemplification of the invention.

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury

Claim 88; Page 87; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGCD).

The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acids (e.g. a ribozyme or a possessing an NCH motif), a G-cleaver (Cleaving RNA with a NRN MN molecule possessing an NCH motif), a G-cleaver (Cleaving RNA with a NRN with a NGY motif). The CD20-targetting nucleic acid is used to cleaving RNA with a NGY motif). The CD20-targetting nucleic acid is used to cleaving RNA with a NGY motif). The CD20-targetting nucleic acid is used conclusion to preferably MG'2+. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting cuse of one or follicular non-Hodgkin's lymphoma, low-grade or follicular non-Hodgkin's lymphoma (MCL), immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunodeficiency virus) associated NHL, mantle-cell lymphoma, immune confined acid is used to cleave RNA of the NOGO gene in the presence of a divalent cation that is preferably MG'2+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and transmin may further comprise the use of one or more therapies.

The compact of particular comprise the use of one or more therapies. In particular, the NOGO-targetting mucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells -

Disclosure; Page 79; 720pp; French.

The invention relates to a novel isolated 17 mer mucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive muclecides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, as one component of a gene chip, in vittor as (afti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, only peptides, vectors containing the nucleic acids, cells containing the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the investment of the califically cancer but also Alzheimer's diseases and schizophrenia. Analysis of the expression of the investment of the calificance of diseases. The polypeptides can also be used to generate antibodies, and

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells

Disclosure; Page 567; 720pp; French

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nuclectides from the 17 mer sequence, a sequence, a sequence with alignment, at least 80 % identity to the 17 mer sequence, a sequence with a least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, and for production of recombinant polypeptides. Any of the nucleic acid, and for production of recombinant polypeptides. Any of the nucleic acid, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene

 Determination of oligo-nucleotide with specific activity for target bio-molecule - using set of randomised oligo-nucleotide(s)
 The present sequence was used in the development of a method of determining an oligonuclectide having specific activity for a target biomolecule. The method comprises assaying a set of randomised oligonuclectides for activity against a target biomolecule, separating active from inactive oligonucleotides and recovering, amplifying and determining the nucleic acid sequence of the active oligonucleotides. The oligonucleotides can be used for therapeutic, diagnostic and research purposes.

The sequences given in AAT48840-41 are primers which were used in the amplification of the rat type II non-pancreatic phospholipase A2 (PLA28) gene. Mutations within this sequence may lead to an individual having an increased risk of colon cancer. The method of the invention Comprises: (a) isolating genetic material from a tissue or body fluid sample from the individual; and (b) detecting a PLA28 gene mutation which is indicative of the individual is at an elevated risk of colon cancer; or (b') detecting the absence of PLA28 protein or PLA28 enzyme activity in an isolated protein sample which is indicative of the individual having an elevated risk of colon cancer. The method allows individual having an elevated risk of colon cancer. The method allows individuals with the APC (adenomatous polyposis coli) mutation to be identified. In the treatment of colon cancer, the patient is administered a recombinant vector incorporated within a non-toxic enteric microorganism which expresses and secretes PLA28.
Identifying an individual at an elevated risk of colon cancer - by detecting mutation(8) in PLA2s gene

Sequences AAZ06571-Z06607 are antisense polymucleotides targeted to a nucleic acid molecule encoding human ELK-1 (also known as p62TCF). ELK-1 is a member of the ternary complex factor subfamily of Ets-domain transcription factor proteins. The polymucleotides inhibit the expression of human ELK-1, and this sequence targets the 3' untranslated region of the ELK-1 RNA. Sequences AAZ06571-Z06607 all causes at least 30% inhibition of ELK-1 expression. The antisense sequences can be used to inhibit the expression of human ELK-1 in human cells or tissues in vitro. ELK-1 uses a bipartite recognition mechanism mediated by both protein-DNA and protein-protein interactions to regulate genes by direct and indirect DNA binding and has been shown to control various signal transduction pathways and other cell functions including apoptosis. This means that diseases associated with its expression of ELK-1 can be used to treat diseases associated with its expression in animals, particularly humans and the control or tumour formation. The compounds can also be used for diagnosis, as research reagents and in Antisense compound useful for diagnosis, treatment and prevention of disease associated with ELK-1 expression

HLA-A allele, PCR primer, human leukocyte antigen-A; diagnosis; allele type determination; ss.

Distinction of HLA-A allele type - using PCR and electrophoresis

This sequence represents a PCR primer for a human leukocyte antigen-A (HLA-A) allele, and can be used in the methods of the invention. The method are for the distinction of HLA-A allele type. In the first method

a set of primers corresponding to each group specific to the base sequence common to each gene in at least one specific group consisting of specific HIA-A allele group is used to eary out a PCR to amplify selectively the HIA-A allele group in each specific group as a group. In the second method the amplified product obtained by the PCR is developed specific size is confirmed to distinct a specific type of the HIA-A allele group in each specific group as a group. Further is confirmed to distinct a specific type of the HIA-A allele group in each specific group as a group. Further, in the second method, if a specific type of HIA-A allele group is distinguished the following methods are further carried out: RFIP method, PCR-SSCP method, SSCP method or PCR-SSCP method. The methods can be used for the diagnosis of HIA-A type in humans.

This invention describes a novel method (I) for specifically detecting a chemical or drug in a sample comprises contacting the sample with an obigonucleotide having specific activity for a target biomolecule and detecting the presence or absence of binding where the presence of binding indicates the presence of the chemical or drug in the sample. The oligonucleotide is identified by: (a) assaying a prepared set of randomized oligonucleotides for activity against a target biomolecule; (b) separating active from inactive oligonucleotides; (a) recovering the active oligonucleotides; and (d) characterizing the recovered oligonucleotides by microanalytical structure determination. The method can be used for diagnostic or research purposes.

RESULT 1161

The present invention describes a collection of binding groups for a family of nucleic acids comprising members of relative high and relative how significance, where the binding groups are selected to be capable to identify, alone or in combination, essentially all members of the family of nucleic acids of relatively high significance. The collection of binding groups is useful for typing of nucleic acid in a clinical sample, by contacting the nucleic acid with the collection and determining whether one or more binding groups bound to the nucleic acid of the sample. This method is useful for determining whether the sample comprises at least a part of a member of relatively high significance of a family of nucleic acids. The collection of binding groups is useful for diagnosing the severity of a disease caused by a pathogen containing a member of a family of nucleic acids. ABL88779 to ABL89321 represent Collection of binding groups for determining or typing samples, especially clinical samples, has groups capable to identify essentially all members of the family of nucleic acids of relatively high HIV-1 related binding molecule oligonucleotide sequence SEQ ID NO:55. oligonucleotide sequences used in the exemplification of the present .. register Alzheimer's Dieges (AD) has been studied and initial mapping analyses have predicted the AD4 locus (also known as STM2) resides on chromosome 1. The present sequence corresponds to a PCR primer which was used during the cloning procedure to isolate and primer which was used during the cloning procedure to isolate and sequence the AD4 gene. The group of families has been designated the Volga German (VG) kindreds. The entire gene has been amplified from VG individuals and unaffected individuals (from VG and individuals have a nucleotide change at codon 141 resulting in an amino acid alteration from Asn to Ile. Portions of a mutant AD4, cespecially one in which Asn at position 141 has been replaced by the cample using antibodies specific for the protein of matent AD4, for example using antibodies specific for the protein of using nucleic acid probes specific for the mutant gene, provides a means of

This PCR primer is used for allele specific amplification (ASA) of the allelic variant of the serotonin 5H77 receptor (5H771eu). This is used for screening large numbers of samples for 5H771eu variant. The invention provides a method for detecting DNA that codes for a 5H771eu allelic variant which comprises amplifying human DNA with primers capable of amplifying a sequence encoding the third intracellular loop of the human 5H77 gene and determining if the amplified DNA comprises a sequence in which a C-to-T alteration converts a Pro codon to a Leu codon. The 5H77leu variant and associated DNA and assays provide important neuropsychiatric drug candidates.

 Diagnosis and treatment of IL-1 mediated connective tissue diseases - using osteopontin, calnexin, TSG-6 gene prod., genes encoding them
 Gaps
 The present sequence is 1 of 4 degenerate 3' oligo dT primers, which were used along with 25 arbitrary 5' oligodecamer primers for the differential display of human chondrocyte mRNA by reverse transcription and PCR (DDRT-PCR). Sequence analysis revealed the sequences of 52 cDNA clones, which were then searched against DNA databases for homology to known human genes. The cDNA mols. can be used for the prodn. of gene specific primers and probes to isolate genes induced by treating (esp. human) chondrocytes with interleukin-lbeta (IL-lbeta), and for the diagnosis of IL-lbeta related connective tissue diseases, in partic. oseteoarthritis or

display, in the method of the invention. The specification describes a method for measuring the level of two or more nucleic acid molecules in a target. The method comprises contacting a probe with an arbitrarily or statistically sampled target and detecting the amount of specific binding of the target to the probe. The methods can be used to identify differentially expressed nucleic acid molecules associated with disease states, such as cancer, autoimmune disease, infectious disease, aging, developmental disorder, proliferative disorder or neurological disorder.

Alternatively the methods can be used to oasses the efficacy or toxicity of or a resistance to a treatment. Also the methods can be used to determine differential expression of nucleic acid molecules in response to a stimulus, e.g. a chemical, dung or growth factor (especially epidermal growth factor), radiation, stress or a pathogen. The methods the account of the determine co-regulated genes that can be potential
 The invention relates to a method of sequential consensus region-directed
 amplification for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples. The methods, kits and oligonucleotides are useful for sorting a mixture of DNAs into 2 or

The present sequence represents a specifically claimed oligonucleotide PCR primer. The oligonucleotide can be used for polymerase chain reaction (PCR) amplification of DNA, specifically regions of specific genes that are conserved among mammalian species, i.e. pairs of oligonucleotides from the present specification represent universal mammalian sequence-tagged alte (DN-STS) primers. The primers are used to develop genomic maps, to isolate clones from libraries, to make cross-species comparisons and to develop additional genetic markers.

This primers AAZ21589-Z21594 are used to amplify the HIV integrase CDNA.

This primer corresponds to nucleotides 4016-4036 of the integrase equence. The HIV integrase (IN) cDNA was used in the generation of an in-chicoric acid resistant strain of HIV. The invention relates to new compounds that are IN inhibitors. The inhibitors are novel compounds that potently and selectively inhibit HIV integrase. The inhibitors are structural analogues of bis (3,4-Dhiydroxycinnamcyl) tartaric acid. Integrase has the minimal activities needed for integration. In vitro the enzyme processes the HIV DNA for insertion in to the host cell's nucleus. IN also cleaves double stranded DNA and facilitates the nucleus. IN also cleaved ends of the host DNA. The new compounds links the HIV DNA to the cleaved ends of the host DNA. The new compounds are synergistic with reverse transcriptase and protease combinations at a different part of the HIV replication cycle. The new inhibitors are used, preferably in combination the treatment of transcriptase inhibitors and protease inhibitors in the treatment of

The invention relates to a replicase complex comprising a hepatitis C virus (HCV) NSSB replicase protein, a linear nucleic acid template and a complementary nucleic acid primer which is annealed to the 3' terminus of the thermolate, where the template is at least three nucleotides and the primer is two or three nucleotides, and the template and primer do not complement of primer is solution in the absence of the HCV NSSB protein. The complex is useful for detecting HCV replicase activity and permits establishment of sensitive RNA-dependent RNA polymerase assays to screen and evaluate antiviral inhibitors and to improve the specificity and efficacy of the inhibitors. The complex is also useful in the development of a reliable system for determining kinetic and thermodynamic constants of HCV NSSB-catalysed nucleotide incorporation and investigation of mechanistic inhibitors for mile incorporation and investigation of screening assays which are used for determining kinetic, thermodynamic complex solutions and mechanistic properties of NSSB replication and ultimately in the development of inhibitors of NSSB replication and ultimately in the complex constants of the properties of NSSB replication and ultimately in the confidence and mechanistics of NSSB replication and ultimately in the confidence and mechanistics of NSSB replication and ultimately in the confidence and mechanistics of NSSB replication and ultimately in the confidence activity may be used for developing anti-HCV pharmaceuticals.

 The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic repeats) are cardidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myctonic dystrophy, hyperaadrogensemia, spinal and bulbar atophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTS.

Polynucleotide encoding LUNX gene product useful for the detection of cancer especially micrometastatic cancer .

Example 1; Page 27; 30pp; Japanese

```
ò
 The present sequence represents a PCR primer which is used in an example from the present invention for the isolation of human TSA7005 gene. The human TSA7005 protein shares 32% homology with human and mouse Reg proteins, and 34% homology with the rat Reg protein. TSA7005 has pancreatic beta cell growth activity and hypoglycaemic activity. The TSA7005 protein can be used for the diagnosis and treatment of diseases
This invention relates to the human LUNX protein and the polynucleotide sequence encoding it. The invention includes a vector containing a LUNX polynucleotide, a host cell transformed with the vector, and an antibody that binds to LUNX. The gene can be used for cancer diagnosis and diagnosis of micrometastatic cancer and for the production of the LUNX gene product. The present sequence represents a primer used in the isolation of cDNA encoding human LUNX.

The invention relates to a probe set for gene expression arrays to provide common equivalent signalling per probe and global amplification of the set. The probe set has a pool of modified cDNA probes, each probe having a central target specific segment copied from a portion of a single mRNA transcript and a universal linker (a WRAP-Probe) located on one or both terminal ends. The universal linker has reporter binding sites to join common reporters to the probes and primer binding discovery assays for a wide range of biomedical samples, including detection of nucleic acids and gene expression captodies in human diagnostics, forensics and genomic analysis. The methods are useful for amplifying and identifying any unknown DNA fragment and also for improving sensitivity with tissue microarrays or RNA arrays. The methods improve the quantification of gene expression and allow highly improved detection of rare transcripts or very small samples. This sequence represents a poly-T primer used in the
 Novel probe sets with common universal linkers at one or both ends (WRAP probes) for gene expression arrays to provide global amplification of probe set and to provide common equivalent signalling regardless of length -

 This sequence represents a primer of the invention. The invention relates to sequences of at least two mucleotides of formula:

X = a labellad no-beta-N3', or (X)mS'-(gamma) k-delta-N3'; where
X = a labelled compound and/or a nucleotide with voluntary sequence;
m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, granine or cytosine;
N = adenine, guanine, cytosine or thymine; gamma = thymine;
k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or lass of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for

 Secreted and transmembrane proteins and nucleic acids designated PRO, useful as hybridization probes, in chromosome and gene mapping and gene
HBM genes have osteopathic activities. The genes can be used in gene therapy, antisense therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, Paget's disease, sclerostosis, osteomalacia and fibrous dysplasia. ABA82038 to ABA82700 and AAG68168 to AAG68193 represent sequences used in the exemplification of the present invention.
 Fong S;
Hillan KJ;
 The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.

The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibits the expression of caspase 7.

(I) has antiinflammatory and cytostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present or delay infection, inflammation or tumour formation. The present calgonic cappase 7 inhibiting chimeric phosphorothicate oligonucleotide having 2 MOE wings and a decoxy gap, which is used in an example from the present invention.
 Novel antisense compounds targeted to nucleic acids encoding caspase 7, for modulating gene expression and treating diseases associated with expression of caspase 7 in humans

 This invention describes a novel recognition system comprising at least recognition unit bound to a support, each recognition unit comprising region A with a defined structure adjacent to a region B with a randomized structure. The recognition system is useful for screening, identifying, or characterizing at least 1 component of a sample, especially nucleic acids and/or proteins, and for screening for and/or identifying cellular or synthetic binding partners, preferably proteins, peptides, nucleic acids, chemical agents, preferably organic compounds, pharmaceuticals, plant protection agents, toxins, venoms, carcinogens, teratogens, herbicides, funglicides or pesticides.
 Recognition system, e.g. for identifying nucleic acids, comprises at least one recognition unit comprising a region with a defined structure adjacent to a region with a randomized structure -

New transgenic animals (e.g. mice), useful as models for studying bone density, modulation, developing drugs for treating or preventing bone diseases (e.g. osteoporosis), or diagnosing diseases characterized by reduced bone density WPI; 2003-129278/12.

Disclosure; Page 54; 603pp; English.

The invention relates to novel transgenic animals expressing the high bone mass (HBM) gene, expressing the corresponding wild type HBM gene, comprising an alteration of the gene encoding LRB5 or LRB6, or expressing an LRB5 that is modulated by an altered gene control expressing an LRB5 that is modulated by an altered gene control sequence introduced by homologous or non-homologous recombination. The transgenic animals are for the study of bone density modulation or bone mass modulation. The invention may have a use in gene therapy. The polynucleotides of the invention may have a use in gene therapy. The polynucleotides of the invention may have a use in gene therapy. The polynucleotides of the same species in more than one parameter of non-transgenic animals and nucleic acids are for the study of bone density modulation, where the bone mass is modulated relative to selected from bone density, bone strength, trabecular number, bone size, or bone tissue connectivity. The transgenic animals, nucleic acids and methods are useful for identifying molecules involved in bone development, and for developing pharmaceutical compositions, which may be employed for treating or preventing bone disease, e.g. neoplasms of the bone. The transgenic animals and nucleic acids are also useful in methods for diagnosing diseases involved in bone development, or characterised by reduced bone density or mass. The present sequence is used in the exemplification of the invention.

The invention relates to a novel method for detecting a point mutation in 20 a DNA strand. The novel method comprises hybridising a target DNA strand containing or suspected of containing a point mutation with a test nucleic acid strand complementary to the DNA strand to form a target DNA strand/test nucleic acid strand duplex, contacting the duplex with an RNASS H, and determining whether the ribonucleotide residues within the nucleotide sequence are cleaved by RNASS H. The method is useful for detecting a point mutation in a DNA strand, where the point mutation to be detected is a single nucleotide polymorphism, preferably a colymorphism in a genome, e.g., a viral, bacterial, eukaryotic, mammalian or human genome. The method is useful to detect any nucleic acids from any species of organisms such as Acintobacter, Bacillus, Candida, Entercoccus, Haemophilus, Mycobacterium and Streptocccus, and viruses. This polymucleotide sequence represents a ribonucleotide relating to the mutation detecting method of the invention.

AAZ26499 RESULT g 

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precencerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic forms of the gene present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atheroscleroiic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney cancers, and graft to versus host disease. The method can also be used to Polymorphism; human, inhibitor; cancer; treatment; cell growth; LOH; cell viability; loss of heteroxygosity; precancerous condition; ASI; allele specific inhibitor; somatic cell; diagnosis; prevention; atherosclerotic plaque; premalignant metaplastic lesion; endometriosis; dysplastic lesion; benign tumour; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow; ss.  The present sequence was used in the construction of an expression vector encoding a modified annexin having an N-terminal chelation site, which comprises an amino acid extension including a glycine and a cysteine residue. The modified annexin is useful for imaging vascular thrombi or apoptosis which is associated with response to a chemotherspeutic agent or with rejection as a result of transplantation. The modified annexin can effectively chelate a radionuclide and retain annexin bioactivity. It can be readily prepared in high radiochemical yield and with high radiochemical purity. In conventional conjugation chemistries that provide a distribution of conjugation products, the modified annexin has a single chelation site remote from the site of biological activity.

The invention relates to an isolated nucleic acid molecule (a promoter of rice chemically induced cDNA (RCI-1), which encodes a lipoxygenase)

Crapable of driving chemically-inducible but not wound or pathogening unducible expression of an associated mucleotide sequence. Also inducible expression of an associated mucleotide sequence. Also comprising the lipoxygenase gene, promoter fragments, the lipoxygenase transit peptide which directs expressed proteins to the plastid, a vector comprising the promoter or fragments are useful for expressing a nucleotide sequence of interest. The transit peptide is useful for targeting an associated protein of interest to plastids. A nucleic acid which expresses polypeptide having lipoxygenase activity is useful for inhibiting fungal mycotoxins when transformed into a plant. The lipoxygenase is useful for inhibiting fungal mycotoxins when transformed into a plant or useful for inhibiting fungal mycotoxins which involves applying a chemical cuseful for actual for seaful and the sequence. Transgenic plants as described above are useful for regulator to a plant or seed containing a chemically regulatable consequence. Transgenic plants as described above are useful for breeding improved plant lines that for example increase the effectiveness of conventional methods such as herbicide or pesticide treatment or allow to dispense with the methods that modified genetic properties.

Conventional methods such as herbicide or pesticide treatment or allow their optimised genetic equipment yield harvested product of better confairing than where not able to tolarate comparable adverse confarable adverse conventions.  The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the nucleotide base position indicated in the DE line.

Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin structures and that contain potential hammerhead and hairpin structures and that contain potential barmerhead and hairpin structures and that contain potential barmerhead and hairpin structures and that contains were identified by computer analysis.

Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid arthritis, asthma and other inflammatory disorders.

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 conscutive nuclecides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of vixal diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzaimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these and near the polypeptides can also be used to generate antibodies, and near the polypeptides can also be used to generate antibodies, and near the polypeptides can also be used to generate antibodies, and near the polypeptides can also be used to generate antibodies, and near the polypeptides can also be used to generate antibodies, and near the polypeptides are useful. both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression therapy. This polynucleotide sequence represents a tumc related human fukutin oligonucleotide of the invention.

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells

Disclosure; Page 691; 720pp; French.

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid e.g. as one component of a gene chip, in vitro as (anti)sense reagents,

and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the nucleic acids, cells containing the preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for disagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention.

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for

```
The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear factor regulation. The enzymatic nucleic acid molecule is adapted to treat configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REEL-A.

(I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and artisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, melanoma, lymphoma, glioma or cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or milidiux resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamica, doxorubin, fluorouracil carboplatin, edatrexate, gemeitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as monoclonal antiple sclerosis, transplant/graft rejection, gene therapy applications, isochaemia/reperfusion injury cepticion, gene therapy applications, isochaemia/reperfusion injury sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel

che method of the invention. The method comprises testing a nucleic acid sample from a mutated organism for a mutation in a gene of interest without the prior observation of a phenotypic alteration in the mutated organism for a mutation in a gene of interest without the prior observation of a phenotypic alteration in the mutated organism resulting from the mutation. Sox-2 is a member of the Sox gene family, and is involved in transcriptional regulation of the FGF-4 gene. FGF-4 codes for a signalling protein whose expression is essential for postimplantation mouse development, and, at later embryonic stages, for implantation mouse development, and, at later embryonic stages, for postimplantation mouse development, and, at later embryonic stages, mutation is identified can be studied and provides mutational screening mutant human sox-2 gene. The method provides mutational screening observation. The method identifies and characterises genes via mutagenesis to identify genes encoding products which may have therefore benefit. The method also identifies the presence of mutations in a gene which do not rely solely upon prior matching of a gene with a disease. Heterozygotic organisms can also be screened to thought the gene mutation in a copy of a gene of interest even thought the desire mutation in a copy of a gene of interest even the book that the contains the presence of the contains the c

(i) in screening and detection assays, e.g. for chromosome mapping, this sue typing or forensic studies; (ii) in diagnosis, prognosis or monitoring clinical trials; and (iii) for treating or preventing EDIRF-related diseases (especially immune, haematopoietic, differentiative, developmental or inflammatory disease, including arthritis and psoriasis. The EDIRF coding sequence, or its fragments, are also useful as probes and primers (for detecting related sequences and disease—associated mutations, also for mutagenesis), for expressing recombinant EDIRF and as source of antisense, ribozyme and peptide nucleic acids for inhibiting translation of EDIRF-derived miNA. EDIRF is used to raise Ab (useful for detecting EDIRF, including forms with aberrant post-translational modification, for affinity purification and therapeutically) and to screen for specific modulators (e.g. peptides or peptidomimetics). This sequence is a PCR primer for DNA encoding the embryo-derived interleukin.related factor (BDIRF) of the invention, designated human PEDIRF II. The EDIRF DNA and protein sequences (and their homologues), antibodies (Ab) specific for BDIRF, and other modulators are used:

Identifying a mutation in a gene of interest in an organism useful for identifying genes encoding products which may have therapeutic benefits

Example 7; Column 69-70; 70pp; English.

This invention describes a novel mutational screening method based on genomic and genetic techniques to identify and characterize a mutation in a gene of interest without first selecting a phenotypic characteristic. The screening methods are useful for identifying genes encoding products which may have therapeutic benefit for treating human or animal diseases. The method can be used for the DNA mutation screening of a class or a family of genes providing a rapid assay for identifying mutant genes. The methods produce organisms which can be used for drug discovery e.g. providing a model for the study and treatment of a disease state, allow in vitro assessment of drug activity and interbreeding of mutants which allow investigation of gene interactions in the overall phenotype. A range of phenotypes associated with different mutations, and specified mutations in a gene of interest can be moter genes of interest in a norganism. The methods allow mutations in a gene of interest to be identified without having to rely on matching a

The invention relates to a method for detection of nucleic acid (I) having at least 2 portions, comprising treatment with nanoparticles that carry oligonucleotides complementary to at least 2 parts of (I), where detectable change caused by hybridisation of the oligonucleotide to (I), is observed. The method is used to detect of diseases, sequencing, in forensic analysis etc., and generally to detect analytes other than (I). The oligonucleotide-derivatised nanoparticles are also useful for preparing nanostructures useful, for example, as biochips, biofilters, mechanical devices, separation membranes, chemical sensors, in computers, and for trug delivery. Very stable nanoparticle-oligonucleotide conjugates can be produced, allowing their direct use (as probes) in polymerase chain reaction, i.e. they survive multiple heating/cooling cycles so not need to be added after amplification. (I) are detected by simple colour change, without the need for special equipment, making possible rapid field testing for e.g. pathogens, and related sequences, used in the

 Attaching fragments of first nucleic acids to second nucleic acids by use of adapters complementary to first single stranded regions on the first molecules but which have a different single stranded region at the other terminus.
 Gaps
 The present invention relates to attaching a fragment of first and second nucleic acid molecules involves use of an adapter molecule which is complementary to a single stranded region generated on the target but which has a different single stranded region at its other terminus and therefore modifies single stranded regions presented for binding by the target. Attaching first and second nucleic acid molecules may be used in cloning. The method can also be used for exon shuffling other recombinations that are relevant in connection with artificial evolutionary systems. The fragment chains may be used to store information.

 The invention relates to a method of sequential consensus region-directed amplification for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples. The methods, kits and oligonucleotides are useful for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples e.g. for disease diagnosis and gene analysis. The present sequence is oligo dT PCR primer used to illustrate the method of the invention.

This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula:

(X)m5 - (alpha)n-beta-N3', or (X)m5' (gamma)k-delta-N3'; where
X = a labelled compound and/or a nucleotide with voluntary sequence;

m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, gammine or cytosine;
N = adenine, guanine, cytosine or thymine; gamma = thymine; gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene sequences.

(STRA-) STRATAGENE

Sorge JA;

WPI; 1992-331724/40.

Prodn. of dicistronic DNA library used to make antibodies, etc. includes forming 1st and 2nd PCR admixtures, subjecting them to PCR thermo-cycles, sepg. double stranded DNA, hybridising, etc.

Claim 14; Page 38; 143pp; English.

This inside PCR primer is used in fusion PCR, working in combination with an outside PCR primer to amplify a target nucleic acid sequence, in this case the Kappa light chain variable region. The fusion PCR reaction is used to produce two fragments with cohesive termini, which when mixed hybridise to form an overlapping DNA duplex that is internally primed. Subsequent PCR extends the non-overlapping region to form a hybrid DNA mol. that is dicistronic contg. a first polypeptide coding sequence and a second polypeptide coding sequence linked by a dicstronic bridge. This method thus allows fusion of the cumbersome separate cloning of fragments.

The murine Kin17 protein includes a zinc finger domain (see AAR6766), recognises single- and double-stranded DNA (partic. regions of secondary structure), has apparent mol. wt. 43 kD and is recognised by both anti-kin17 antibodies and antibodies against the RecA protein of E.coli. The Kin17 protein is involved in DNA repair; it can be used to monitor chromosomal rearrangements following exposure to genotoxic agents. Specific oligomucleotides (AAQ79937-Q79947) derived from the kin17 genomic DNA sequence, are claimed and can be used as hybridisation probes or as amplification primers. (Updated on 25-MAR-2003 to correct PN field.)

 HANGE STATE OF STATE
 AMISO699-T50754 represent target sequences for the rabbit cholesterol caster transfer protein (CETP) hairpin ribozymes (see AAT50643-T50698).

CETP is a 74 KD glyroproteins. The numbering of the targets refers to the between plasma lipoproteins. The numbering of the targets refers to the between plasma lipoproteins. The numbering of the targets refers to the books to 4-6 nucleotides 5', and a variable number 3' of this site. The ribozymes are able to cleave mRNA from the gene encoding CETP, thereby the reverse cholesterol transport (RCT) pathway can be inhibited (or density lipoproteins (HDL), prologing HDL half life, and therefore consists of the reverse cholesterol transport (RCT) pathway can be inhibited (or increasing HDL) prologing HDL half life, and therefore associated with abnormal levels of CETP, specifically atherossis. Complications of diabetes, transplant, atheroscolerosis, complications of diabetes, transplant, atherectomy and angioplastic complications of diabetes, transplant, atherectomy and angioplastic restenosis. By inhibiting CETP, the levels of EDD, and the HDL:LDL ratio are favourably altered (a cerease in LDL levels), and the HDL:LDL ratio are favourably altered (a ribozymes can also be used diagnostically to study genetic drift and carged specific regions of the CETP gene, they have low non-specific

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGP). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fit-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (fik-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing angiogenesis, ocular diseases, psoriasis and theumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
 Nucleic acid molecule modulating VEGF receptor(s) gene expressingNA stability - useful for treating e.g. tumour anglogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient

Expression of mammalian target genes is achieved by using chromosomal target DNA, either native primary cells or yeast artificial chromosomes (YACS) in a yeast host, where the YACs include a fragment comprising the target gene. An amplifiable gene is integrated (using homologous recombination) into the mammalian fragment a site to allow for amplification. The resulting construct (optionally modified by in vivo mutagenesis) can be transformed into a mammalian expression host and integrated into the host genome, either randomly or by homologous recombination. The amplifiable gene can then be expressed and host cells which produce high yields of the desired protein are selected. In a specific example of this new method, YAC targetting vector pYGT2 was constructed to create sequences orpable of directing the modification of the human G-CSF polypeptide; vector pYGT2 contains: a '-targetting region (i.e. nucleotides #1180 to +1480 of the G-CSF gene), an IGQ2 heavy chain CDNA encoding the yeast HIS2 selectable marker, and a 3'-targetting region (i.e. nucleotides #1496 to +2599 of the G-CSF gene). The present sequence is that of a PCR primer which was used in the construction of pYGT2. AAT99157-T99188 represent amplification primers used in the invention. These sequences were used to amplify developmental sequences, to determine the expression of the protein of the invention in various stages of embryo development. The protein of the invention is the anti-dorsalising morphogenetic protein (ADMP-1) of Xenopus. ADMP-1 is closely related to the human bone morphogenic protein 3 (BMP-3). The ADMP-1 can be used to treat and diagnose conditions involving inappropriate tissue proliferation, e.g. neuroblastoma, neuroma and neurofibromatosis. The polymucleotide can be used to probe mammalian DNA iteration.

This primer was used for reverse transcription of RNA isolated from mouse tumour lines L-RT101 (epidermal tumour cell line) and H-TX (spontaneously transformed liver line). It was also used as the reverse primer in PCR amplification of the resulting cDNA. Primers Pl and P2 (see AAX87333) reproducibly detected differential expression of a gene between 1,10-phenanthroline (OP)-treated and OP-nontreated L-RT101 and H-TX cells. An OP-inducible clone was used as a probe to isolate a full length clone (see AAX87333)
 corresponding to the mouse sensitive to apoptosis gene (SAG). SAG is a redox-sensitive, haem-binding protein domain that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype.

This sequence is a PCR primer for DNA encoding the embryo-derived interleukin-related factor (BDIRF) of the invention, designated human EDIRF II. The EDIRF DNA and protein sequences (and their homologues), antibodies (Ab) specific for EDIRF, and other modulators are used:

(i) in screening and detection assays, e.g. for chromosome mapping, tissue typing or forensic studies; (ii) in diagnosis, prognosis or monitoring clinical trials; and (iii) for treating or preventing or EDIRF-related diseases (especially immune, haematopoietic, anthritis and psoriasis. The EDIRF coding sequence, or its fragments, are also useful as probes and primers (for detecting related sequences and also useful as probes and primers (for detecting related sequences and clisease-associated mutations, also for mutagenesis), for expressing nucleic acids for inhibiting translation of EDIRF-derived mNNA. EDIRF is used to raise Ab (useful for detecting EDIRF, including forms with abertal post-translational modification, for affinity purification and nantiforminerics)

New nucleic acid reference material comprising two reference sequences for use in the polymerase chain reaction and for verifying nucleic acid amplification reactions by acting as a control -

Example 1; Fig 1B; 54pp; English.

```
The specification describes a nucleic acid reference material, which comprises two reference sequences, each with a pair of primer binding sites which are the same except for the substitution of one or a few nucleotide bases. The reference material is used in the polymerase chain reaction (PCR). The reference material is used as a control for cention (PCR). The reference material is used as a control for cention (PCR). The reference material is used as a control for material is designed to be used in isolation in PCR systems or simultaneously within PCR assays, to control for and allow the measurement of PCR specificity CR assays, to control for and allow the measurement of PCR specificity and sensitivity. Amplification reactions that can be verified include ligase chain reaction, gapped ligase chain reaction, strand displacement amplification, nucleic acid sequence based amplification and self-sustained sequence replication. The reference material is particularly useful where detection of target sequences in medical or environmental samples is desired. AAA63609-21 represent internal CR inbosomal RNA gene. A fragment of the 16S ribosomal RNA gene.

The present sequence is one of a large number of antisense oligomucleotides designed to target different regions of the human CD44 mRNA. CD44 is a multifunctional human cell surface adhesion receptor. The oligomucleotides were analysed for effect on CD44 mRNA levels by quantitative real-time PCR analysis. Antisense oligomucleotides that inhibit CD44 expression can be used to treat CD44-associated conditions inhibit cD47 expression can be used to treat cD44-associated conditions oncluding hyperproliferative disorders, such as cancer, and inflammatory hybridise to CD44 nucleic acids, thus allowing sandwich and other assays to be easily constructed.
 Note: The sequence has a phosphorothioate backbone and may be either an oligodeoxynucleotide or a chimeric oligonucleotide containing 2'-methoxyethyl (2'-MOE) wings and a deoxy gap. The ISIS number given above corresponds to the oligodeoxynucleotide sequence.
 New antisense compound, that inhibits the expression of human cell surface adhesion receptor CD44, for treating hyperproliferative disorders and inflammatory conditions, such as cancer and rheumatoid

The present sequence is that of the forward primer used in the real-time quantitative PCR amplification of cancer specific gene Proll4 (see AAZ95010 and AAZ9501). Proll4 mRNA expression is higher in prostate than any other healthy tissues examined, indicative of it being a diagnostic marker for diseases of the prostate, especially cancer. The invention provides ESTs and full-length contigs for CSGs (see AAZ94998-S25017). The CSGs, polypeptides encoded by them, and antibodies that specifically bind CSG are used in claimed methods for detecting, diagnosing, monitoring, staging, imaging and treating prostate cancer.

New antisense compounds that limit the expression of human TRADD protein, useful in the treatment and diagnosis of cancer, inflammation and septic shock

Claim 3; Page 51; 85pp; English.

The intracellular protein TRADD has been identified as a critical link between tumour necrosis factor (TNF) receptor binding and downstream activation of NF-kappa-B. Overexpression of native TRADD activates NF-kappa-B in the absence of TNF and dominant negative

mutants of TRADD block TMF-induced NF-kappa-B activation. A second (frect of TMF in many cell types is the induction of apoptosis (programmed cell death). TRADD overexpression has been shown to mimic TMF induction of apoptosis as well. Data indicates that TRADD and other downstream effector proteins are the rate limiting step. The faction and would therefore serve as the most efficient targets for inhibition of TMF-induced events. Antisense oligonucleotides capable of inhibiting TRADD function may therefore applications. Inhibiting expression of TRADD by contacting human applications. Inhibiting expression of TRADD by contacting human cells or tissues with the antisense compound may be used to treat a septic shock, inflammation, or cancer. TRADD expression, for example, cligonucleotides of varying inhibitory capabilities are listed in exhibit enhanced inhibitory capabilities are listed in the contact of the capabilities and they have 2'-MOE wings and a deoxy gap.

WPI; 2000-292434/25

New antisense compounds targeting nucleic acids encoding human G-alpha-il useful for modulating G-alpha-il expression and for treating diseases associated with G-alpha-il expression

Claim 3; Column 38; 31pp; English.

Human G-alpha-il is a member of the di subfamily of G proteins which is involved in hormonal inhibition of adenylyl cyclase and in the regulation of plasma membrane enzymes. The expression of G-alpha-il is altered in some tumours. The present sequence is a G-alpha-il antisense oligomucleotide, which can be used to inhibit the expression of human G-alpha-il. The invention relates to antisense oligomucleotides represented in AAA10814-A10853, which can be used in the treatment of diseases or condition associated with the expression of G-alpha-il by

=

modulating the expression of G-alpha-il in cells or tissues. The artisense compositions may also be used prophylactically, e.g. to prevent or delay infection, inflammation, or tumour formation.

Furthermore, the antisense oligomoclectides may also be useful in sesarch and diagnostics, e.g. in detecting nucleic acids encoding G-alpha-il by conjugation of an enzyme to the oligomoclectide, or radiolabelling the oligomoclectide. Kits using such detection means for adiolabelling the level of G-alpha-il in the sample may also be prepared. Antisense oligomoclectides, which are able to inhibit specific gene expression, are often used to elucidate the function of particular genes. These antisense compounds are also used to distinguish between functions of various members of a biological pathway. 88888888888888888888

Detecting mutations in selected genes, useful e.g. for identifying therapeutic targets or products, by analysing DNA in mutated embryonic stem cells without phenotypic characterization

Example 6; Column 32; 66pp; English.

PCR primers AAA05245-A05406 are used to generate amplimers from the mouse Sox-3 gene, Sox-2 gene, T gene, tyrosinase gene, Tryp-1 gene, Sry gene, MGF (mast cell growth factor) gene, -xiti gene, and the Pax-6 gene. The primers are used in a method for the identification of a mutation in a selected gene in a tissue without the prior observation of a phenotypic alteration in the mutated organism or cell. The method is used to identify mutations in a selected gene that encode products of potential therapeutic activity or that are potential targets, particularly where the gene of interest has been identified as a functions of gene by positional cloning. Other applications are determining different mutations in a particular gene and identification of

particular mutations. Animals containing an identified mutation are used as models for studying diseases or their treatment, and cells from them for in vitro assessment of drug action. Interbreeding of mutant mice is used to investigate genetic interaction in the overall phenotype.

Antisense inhibition of human RIP-1 expression, useful for diagnosing, preventing and treating conditions such as inflammation -

Claim 3; Column 27; 26pp; English.

This sequence represents an antisense oligonucleotide which binds to the coding region of human RIP-1. RIP-1 (also known as RalBF1 and RIIP) is a GTPase activating protein (GAP) thought to be a downstream target of Ral. The invention relates to antisense phosphorothioate oligonucleotides with anti-infective, anti-inflammatory and cytostatic activity. The oligonucleotides are RIP-1 antisense inhibitors and are used in the diagnosis, prevention and treatment of conditions associated with RIP-1 expression. Conditions associated with RIP-1 expression include various inflammation and tumour formation.

 This invention describes a novel mutational screening method based on genomic and genetic techniques to identify and characterize a mutation in a gene of interest without first selecting a phenotypic characteristic. The screening methods are useful for identifying genes encoding products which may have therapeutic benefit for treating human contained diseases. The method can be used for the DNA mutation screening of a class or a family of genes providing a rapid assay for identifying mutant genes. The methods produce organisms which can be used for drug discovery e.g. providing a model for the study and treatment of a disease state, allow in vitro assessment of drug activity and interbreeding of mutants which allow investigation of gene interactions in the overall phenotype. A range of phenotypes associated with different mutations, and specified mutations in a gene of interest can be determined. The method can be adapted to screen for a mutation in two or more genes of interest to an organism. The methods allow mutations in a gene of interest to be identified without having to rely on matching a gene with a disease. Az43260-Z43421 represent PCR primers used in the

This invention describes a novel method for the parallel detection of the methylation status of genomic DNA (I) which involves a (I) sample being treated chemically to convert 5-unmethylated cytosine to uracil, thymidine or some other base having hybridization behavior different from that of C, then amplifying simultaneously at least 10 different fragments of fewer than 2 kb) using synthetic oligonucleotide (ON) primers. These primers are based on regulatory, transcribed and/or translated segments primers are based on regulatory, transcribed and/or translated segments present in the sample after chemical treatment. The sequence context of all, or some, of the CpG and CpNpG motifs in the amplified products is then determined. The method is used to detect aberrant methylation patterns in the genome, those are implicated in regulation of transcription, genetic imprinting and tumorigenesis. Many target regions in the genome can be analyzed simultaneously and it is not essential to know the sequence context of all targeted regions. Primers may be designed for preferential amplification of particular segments of

New mutated gene for human betal-adrenoreceptor, useful for drug development and in genotyping for predisposition to cardiomyopathy

Disclosure; Page 6; 23pp; German

This invention describes a novel human betal-adrenoreceptor gene (I)
that comprises 1-7 or more mutations, excluding the sequence with the
mutations Alat45Gly or GlyllofSCys. The invention also describes (I)
a method for determining predisposition to disease by genotyping DNA of
(I) at one or more exchanged position and comparison with a reference
sequence; and (2) a new variant of the betal-adrenoreceptor (II) which
include at least one of the amino acid changes Ser49Gly, Ala59Ser,
Gly389Arg, Arg399Cys; His402Arg, Thr404Ala and/or Pro418Ala, but
excluding the sequence with a single amino acid exchange at positions 49
or 389. Genoryping of (I) is used to determine predisposition to
cardiomyopathy, specifically the dilative form, also for prognosis and
assessing severity of this condition. Gene (I) can be used for the
following: (I) development of therapeutic agents, especially a new class
of betal-adrenoreceptor (ant)agonists; (ii) construction of genes or
vectors, especially for pharmaceutical development; and (iii) develop
diagnostic kits, particularly for determining predisposition and
cluding predisposition to develop side effects and habituation.

o,
 This invention relates to an antisense compound targeted to a nucleic acid molecule encoding a member of the human Rho family of small GTP binding proteins, where the antisense compound inhibits the expression of the member of the human Rho family. The invention includes antisense oligonucleotides AAF94580 - AAF94637 which target a RhoA nucleotide sequence, AAF94665 - AAF94784 which target a RhoC nucleotide sequence, AAF94725 which target a RhoC nucleotide sequence, AAF94775 which target RhoG nucleotide sequence, AAF94769 which target a Rac 1 nucleotide sequence and AAF94795 - AAF94809 which target a Rac 1 nucleotide sequence and AAF94795 - AAF94809 which target a Rac 1 nucleotide sequence. The antisense compound is useful for treating hyperproliferative conditions, especially cancer, abnormal wound healing or clotting conditions and ischaemia/reperfusion or reoxygenation injury. The compound may also be used to diagnose the above conditions.

 The invention provides antisense compounds capable of inhibiting the expression of human Her-3, a member of epidermal growth factor (EGF) family of receptor/tyrosine kinases. The antisense oligonuclectides are useful for inhibiting the expression of Her-3 in cells or tissues. They are commonly used as research reagents and in diagnostics for example, to alludate the function of particular genes. The antisense compounds are abiological pathway and for research use. They are also utilized for biological pathway and for research use. They are also utilized for prophylactically, e.g. to prevent or delay infection, inflammation or tumor formation. Sequences AM447522-47615 represent chimeric antisense phosphorothioate oligonucleotides having 2'-MOE wings and a deoxy gap, used for the inhibition of Her-3 mRNA expression.

The present invention relates to a method for detecting a base at a pre-determined position in a nucleic acid molecule. The method comparises performing primer extension reactions using base-specific comprises performing primers, each being specific for a particular base at the predetermined position. The allele-specific (As) primer extension assay method of the invention is useful for detecting an allele-specific base at a pre-determined position in a nucleic acid molecule, for high throughput single nucleotide polymorphism (SNP) analysis, and for detecting mutations and genetic variations. The new method solves the deficiencies of previous methods by providing a method of allele-specific extension that allows accurate discrimination between matched and mismatched configurations, as well as reducing or eliminating false positive results observed in prior art. The use of two allele-specific primers increases the sensitivity by a factor of two because signals of two extensions are obtained. The present increase in the examples of the present

orders for production and delivery of selected synthetic DNA. The system of the invention is useful for marketing synthetic DNAs of different base sequences and concentrations according to the desire of the user, especially genes concerned with human major histocompatibility complex (MHC). Oligonucleotides ABT06196 - ABT06778 are used in the invention.
 The invention comprises a method for the synthesis of an end-labelled probe array - in which part of a probe for capturing a target substance is fixed at a plural of the matrix sites on the surface of a probe array substrate. In the method of the invention the units for constituting the probe are combined successively and, at the final stage of the successive synthesis, a labelling substance is combined to the end of the probe and extended to a desired chain length. The method of the invention is useful for the production of a probe array. The present DNA sequence represents an oligonucleotide that was used in an example of the invention.

The present invention relates to a method of analysing an unknown nuclea acid base sequence. The method comprises preparing a probe array, hybridising with the probe array, measuring the fluorescence yield in the reaction, obtaining a template pattern, producing a sample pattern, and comparing the sample pattern with the template pattern. The method is useful for specifying an unknown base sequence at a defined site of a target single-tranded nucleic acid, which is useful for analysing a nucleic acid base sequence. The method is applicable in DNA diagnosis and therapy, and is useful in medicine and biology. Measuring the fluorescence yield allows the detection of a one-base mismatch which can be considered to produce high detection accuracy. The Mybrid pattern of the DNA probe is used so the difference in thermostability is less important, and the judgement on each spot can be reliably carried out. ABK72202 represent sample origonucleotides used in the present invention.

 The invention relates to producing a probe support. The method involves (a) providing a liquid discharging device including reservoirs for containing liquids containing the probes and discharge nozzles connecting with the corresponding reservoirs; (b) aligning the discharge nozzles and the support relatively, and (c) discharging the liquids containing the probes from the discharge nozzles to different positions on the support. The number of reservoirs and discharge nozzles are the number of probes. The method is useful for producing probe supports useful in base sequence analysis of gene deoxyribonncleic acids (DNAs) and gene examination. The present sequence represents a probe used in a hybridisation assay.
samples from different sources are present on each matrix divided on a substrate. The method is used for determining simultaneously the reactivity of a first sample with several other differing samples. ABLS9636 to ABLS9701 represent oligonucleotide probes used in an example

The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligonucleotide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation between loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate
 Fluorescently-labeled nucleic acid probes for assaying nucleic acids and their polymorphism and mutation, particularly useful in science and medicine for e.g. analytical applications, disease diagnosis and microbial identification

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (b) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified and laters! (f) the mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified products; (h) the clones in the multiwell correspond from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABI42357 to ABI45322 represent PCR primers for human chromosome and Arrayed. The correspondent of companies of the maximum chromosome and Arrayed. The correspondent of the maximum chromosome algazı!, which are specifically claimed for use in the present invention.

 The sequence represents a two-base mismatch probe designed to detect a variation a specific base in the p53 gene sequence. The invention relates to a novel method for screening for a variation in a nucleic acid sequence. The method involves using a DNA array in which a group of probes which will give strong signals forming hybrids with a normal gene sequence, and a group of probes having sequences expected to form hybrids with gene variants are separately arranged. The method is useful for
 screening for the presence or absence of variation in a mulleic acid sequence. The method is also useful for mass screening to determine rapidly the presence or absence of a gene variation without need of an
 Screening for gene variation by using DNA array in which probes giving strong signals forming hybrids with normal sequence, and probes having sequences expected to form hybrids with variants are separately

The invention relates to a novel method for synthesising a target base sequence-containing nucleic acids. The method comprises the formation of single-stranded nucleic acids, synthesis of complementary strand by annealing; and producing single-stranded nucleic acid from a target base sequence by the synthesis of a complementary strand by annealing of a complementary base sequence. The method is useful for synthesising a target base sequence-containing nucleic acids, which is applicable in detecting SNP (single nucleotide polymorphism) in genes, identifying detecting seases, cancer and microorganisms. Such a method can be easily, rapidly and freely carried out without being influenced by contamination or complicated temperature control, but with improved reaction specificity, high accuracy and efficiency, operable at low cost. Synthesising method of the invention.
 The invention relates to preparation of a probe array by high speed and accurate dropping of the probe solution to improve quality of the probe array. The probe array is useful in the analysis of base sequences of DNA and reliable genetic screening of multiple items. The present sequence is that of a probe used in examples of the invention.

Method for comparing mRNA from different nucleic acid samples reverse transcription and amplification using oligo-T primers

WPI; 1997-503123/46.

Primers AAV03374-421 are enhanced specificity anchor primers that bind for the polyA tail of mRNA and cDNA. The primers are of the general formula: TI2MNN, where M is A, G or C and N is A, G, Cor T. The primers are used in the method of the invention. This method compares the presence or level of individual mRNA molecules in at least 2 nucleic acid samples. The method comprises contacting each of the nucleic acid samples with a chigodecxynucleotide primer that hybridises to a first site in mRNAs in the nucleic acid samples, reverse transcribing the mRNAs to which the primer by princiases to produce a population of DNA strands that are complementary to the mRNAs in the 2 samples. The amount of cDNA produced is quantified. The populations of cDNA are contacted with a second oligodeoxynucleotide primer (e.g. present primer) that hybridises Disclosure; Fig 4B; 44pp; English.

to a second site in the cDNA populations, the contact being performed under conditions in which the second primer hybridises with at least some of the DNA strands in the 2 populations. Portions of the DNA strands are amplified to produce a second population of amplification products. The presence or level of individual amplification products in the first and second populations of amplification products in and contaminating cDNAs are subtracted from the re-amplified product. The method can be used for screening differences in gene expression between various cell types or between cells in different stages of development or cells under different pharmacological conditions.

Detection of cancer cells in tissue samples - by changes in mRNA expression compared to normal tissue of specific cancer-associated gene sequences

Disclosure; Page 79; 92pp; Japanese.

- by

The primers AAV43732-V43776 were to produce cancer associated gene fragments which can be used to detect cancer cells in tissue samples or biological fluids. They are detected by monitoring the change in mRNA expression as compared to normal tissue of one or more cancer-associated genes whose cDNA stringently hybridises to the nucleic acid fragments. The change in expression may be an increase or a decrease compared to normal tissue. The mRNA expression may be determined by PCR, Northern blotting or ribonuclease protection may be determining the change in the amount of protein encoded by the gene(s) as compared to normal tissue, for example by using a labelled antibody recognising the protein. Detection of cancer cells for cancer diagnosis, including detection of metastatic cancer cells in tissues other than the primary tumour site.

This invention describes a novel method for the analysis of specifically hybridized probes of varying mass for identification of nucleic acid molecules by matrix-assisted laser describion/ionisation mass pectrometry (MALDI). The method comprises (i) hybridizing a nucleic acid molecule with a predetermined probe having a different mass; (ii) separating unhybridized probes, (iii) contacting the hybridized probe by a laser beam, (iv) analyzing the hybridized probe in the surrounding matrix with an electrical conductive material consisting of a probe of matrix with an electrical conductive material consisting of a probe of nucleic acid molecule, where the position of the probe on the carrier defines the order of the hybridized nucleic acid molecule. The matrix act of warious probes.

In useful for the simultaneous characterization of several unknown consisting acid molecules with a set of various probes.

This invention describes a novel method for the analysis of specifically hybridized probes in solvents by electrospray mass spectrometry for identification of nucleic acid molecules. The method involves (i) hybridization of a nucleic acid molecule with a predetermined probe, where each probe has a different mass and separation of unhybridized probes, (ii) removal of the specifically hybridized probes in a solvent, (iii) analysis of the hybridized probe in the solvent by electrospray mass spectrometry and (iv) determination of the nucleic acid molecule through the hybridized probe. The method is useful for the simultaneous characterization of several unknown nucleic acid molecules entry and contractive and mass spectrospray and contractive of the nucleic acid molecules characterization of several unknown nucleic acid molecules with a set of

cDNA clones. The rubisco small subunit gene promoter is used in the process of the invention. The specification describes a process for converting storage reserves (such as protein, carbohydrate and lipid reserves) in dicot plant seeds into compositions of dicot seeds into compositions comprising one or more desired gene products, based on a source-sink principle. The process comprises harnessing the regulatory
 PCR primers AAH25459-72 were used for isolation and cloning of rubisco
 Novel differential display reverse transcription PCR method used to detect genes expressed in mutant tissues \, \cdot \,
 Novel process of converting storage reserves of dicot seeds into compositions comprising desired gene products, based on source-sink
 This sequence represents a T11N oligonucleotide (A0) used in a novel differential display RT-PCR (DDRT-PCR) method of detecting genes expressed in tissues, especially mutant tissue. The oligonucectide was used to prime a reverse transcription reaction on RNA isolated from adult male w/wv azoospermic mutant mice testes. 324 PCRs were performed on the resulting cDNA using 3' clamp primers and variable decamer 5' primers (see AA234667-95). Differentially expressed clones were used as probes in northern bybridisation, and a novel gene product that was preferentially upregulated in w/wv mouse testis was identified, and termed Alzheimer-associated beta-amyloid binding protein (ERAB, see

 This oligomer is used in the construction of the DNA probe of the invention. This sequence is used in the preparation of the DNA probe YOA-13S. The probe contains an optically active phosphorus atom, DNA and a fluorescent intercalated dye. The invention also relates to a method of selective cleavage of a trialkylsilyl ether linkage used for preparing the probe. The DNA probes are used to obtain oligonuclectides which can be used to identify, extract and control expression of a target gene, useful in genetic engineering, clinical diagnosis and medical treatment. When the probe binds to its complimentary oligo-dT the fluorescence

Vaccinating against tumors, infectious diseases, allergies and asthmausing immunostimulatory  $Py{\rm -rich}$  and TG nucleic acids -

Claim 101; Page 55; 338pp; English.

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immunos immune response. The present sequence is one such immunostimulatory nucleic acids can be pyrimidine rich modeic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpewiridae, retroviridae and/or crthomyxoviridae), bacterial antigens (e.g. herpewiridae, retroviridae and/or crthomyxoviridae), bacterial antigens (e.g. herpewiridae, retroviridae staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a labor to a Thl immune response and to activate immune cells.

Novel antisense inhibitor of apoptosis nucleic acid useful fe enhancing apoptosis in a cell, for treating cancer and other proliferative diseases

Claim 8; Page 33; 135pp; English.

The invention relates to an inhibitor of apoptosis (IAP) antisense nucleic acid (1) that inhibits IAP biological activity, regardless of length of the antisense nucleic acid, the IAP proteins may be mouse or human XIAP, HIAP1 or HIAP2. Also included are a pharmaceutical composition comprising a mammalian IAP antisense molecule and a method of enhancing apoptosis in a cell, comprising administering a negative regulator of the IAP anti-apoptotic pathway to the cell. The IAP antisense inhibitor is useful for enhancing apoptosis in a cell in a development, viral pathogenesis, autoimmune disorders, neurodegenerative diseases, multiple sclerosis, lupus erythematosus and infection by herpes virus, pox virus and adenovirus). The present sequence is an IAP mammal diagnosed with a proliferative disease. The method is useful for treating a parient diagnosed with a proliferative disease like cancer. The IAP antisense molecule is useful to treat, ameliorate, improve, sustain or prevent proliferative diseases (e.g. ovarian cancer, sustain or prevent proliferative diseases (e.g. ovarian cancer, adenocarcinoma, lymphoma, pancreatic cancer,) and also in diseases or conditions where apoptosis is involved or implicated (e.g. embryonic virus, pox virus and adenovirus). The antisense molecule of the invention.

The invention provides methods for treating a disease condition in a patient or suppressing tumour cell growth. One method (M1) involves administering an antagonist of G protein coupled receptors, GPR4 or TDAG8, or contacting the tumour cell with an antagonist of GPR4 or TDAG8. Contacting the tumour cell with an antagonist of GPR4 or TDAG8. Composition or lysophosphatidylcholine (LPC); A third contacting the tumour cell growth in vivolves measuring the level of sphingosylphosphorylcholine (SPC) in the patient. (M1) is useful for treating a disease such as conformant-plck disease type A and atopic dermatitis, and for suppressing tumour cell growth in vivo in a human. (M2) is useful for treating or preventing an inflammatory disease conditions, atherosclerosis, liver cirrhosis, arthritis, endometriosis, cancer or Alzheimer's disease in a human. (M3) is useful for determining the progress of and detecting the presence of a disease condition, in particular ovarian cancer. A composition comprising a synthetic peptide capable of binding to SPC, is composition comprising with the binding of SPC to a GPCRs such as OGR1, GPR4 GPR4 CDNA.

The present invention describes a method (M1) for determining a toxicological response to an agent, which comprises comparing the expression profile of one or more human toxic response genes to a creference gene expression profile indicative of toxicity, and so determining the presence of a toxic response to the agent. Also described: (1) an array comprising one or more polymucleotides selected Irom the genes corresponding to the partial sequences given in ABZ82842 to ABZ84764, or their fragments of at least 20 nucleotides, or homologues; and (2) determining to the partial sequences given in ABZ82842 to it response gene plays a role on toxic response pathways by determining the expression profile of the gene after exposure of cells or a human subject to a known toxic pharmaceutical or industrial agent, comprising; (a) expossing cells to an agent (b) obtaining the test gene expression profile for a putatively identified toxic response gene after exposure to a known toxic pharmaceutical or industrial agent; and comparing the test profile of the expression profile of the expression profile of a gene with a similar function or comparing the test profile to the expression profile of the expression profile of the expression profile of that gene after exposure to a similar function or comparing the test profile to the expression profile of that gene with a similar function or comparing the test profile to the expression profile of the expression profile of that gene with a similar function or comparing the test profile to the expression profile of the exposure to other known toxic oppounds. The
 methods are useful for predicting and determining toxicological responses on a cellular, organ or system level. The arrays comprising the human genes are useful for toxicological screening of drugs, pharmaceutical compounds and chemicals.

 containing a vector comprising the ZSIG-11 project, the containing a vector comprising the ZSIG-11 is a novel ligand polypeptide and specific antibodies can be used to detect its presence in a biological sample. Probes derived from ZSIG-11 is a novel ligand can also be used in detection of ZSIG-11 RNA. ZSIG-11 mucleotide sequences right levels in testis, and could be used to identify/study prohormone convertases or endoproteases that exhibit testis specificity. Antagonists, including antibodies, are useful for inhibiting or all minating the function of ZSIG-11. It is possible that ZSIG-11 and its antagonists will be useful as fertility inducing therapeutics. Sequences AXX34800-21 represent PCR primers for amplifying the ZSIG-11

The present invention describes an isolated, purified or recombinant polynucleotide (PN) (1) comprising a contiguous span of 8 to 50 ucleotides, where the span includes a G713 or chromosome 13431-433 related biallelic marker. (1) has neuroleptic activity and can be used estimate the frequency of an allele of a G713 or chromosome 1341-433 related biallelic markers in a population. (1) is also useful in detecting of biallelic markers in a population. (1) is also useful in detecting of biallelic markers in a population. (1) is also useful in detecting of biallelic markers in a population. (1) is also useful in detecting cof biallelic markers in a population. (1) is also useful in detecting an association between a genotype and a trait being schizophrenia. The genotype is used to determine whether an individual can association petween a genotype and a trait being schizophrenia and bipolar disorder. Early disorders such as schizophrenia in this of developing schizophrenia is possible, which would enable early and/or prophylactic treatment. AAA55964 to AAA55966 represent human G713 genomic DNA sequences, AAA55967 encodes the human C713 protein AAY59062; AAA55968 encodes the murine G713 protein AAY59061, and AAA5691, and AAA56931 and AAA5691 represent human G713 protein human G713 protein human G713 protein human G713 protein human G713 genomic DNA sequences, AAA55967, and AAA56931 and AAA5691, and AAA56931, and AAA5691, and AAA56931 and human G713 protein hu

Sequences AAC92827-C92906 represent phosphorothicate antisense oligonucleotides targetted to the phosphatidylinositol 3-kinase p55 gamma coligonucleotides targetted to the phosphatidylinositol 3-kinase p55 gamma gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of human PI3 kinase p55 mRNA species, and were canalysed for their effect on PI3 kinase p55 mRNA levels by quantitative cral-time PCR. PI3 kinase p55 gamma (also known as hp55-gamma, PIX3R3 and p55PTK) is one of several PI3 kinase regulatory subunits that may associate with the PI3 kinase cat as downstream of receptor tyrosine kinases such as growth factor and chromone receptor tyrosine kinases such as growth factor and oncogene products, and are found in association with the oytoplasmic domains of such receptor (IR) and the cytoplasmic domains of such receptor (IR) and the insulin-like growth factor receptor (IGFR), which play important roles in growth, differentiation and apoptosis. P13 kinase p55 gamma is thought to be developmentally regulated, as four distinct mRNA species are found in adult tissues. The oligonucleotides of the invention are expressed in feetal tissues. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with P13 kinase p55 expression; such as tumour formation, inflammation cut alternatively spliced forms of P13 kinase p55.
 Novel antisense compound targeted to human P13 kinase p55 gamma specifically hybridizes with and inhibits the expression of human P13 kinase p55 gamma, useful for modulating the expression of P13 kinase p55 gamma in cells

WO200229066-A1

11-APR-2002

The invention relates to an antisense oligonucleotide compound of 8 to 50 mucleotides in length that is targeted to a nucleic acid molecule encoding caspase 6, where the oligonucleotide specifically hybridises with and inhibits the expression of caspase 6. The oligonucleotide of the invention specifically hybridises to and inhibits expression of caspase 6 in cells or tissues. The oligonucleotides can be administered the aspase 6 or condition associated with caspase 6, such as Rieger's syndrome or ataxia telangiectasia, hyperproliferative disorder, a haematopoietic disorder, a bone metabolism or cholesterol disorder, various types of cancer, neurological conditions such as Alzeimer's disease and other deregulated apoptotic pathological conditions. This polynucleotide sequence represents a human caspase 6 PCR primer relating to the invention. Gaps An antisense oligonucleotide of 8 to 50 nucleotides in length that inhibits caspase 6, is useful for treating Rieger's syndrome -; 1.3%; Score 14.8; DB 1; Length 20; 88.9%; Pred. Best Loca Matches 

The present sequence is that of a primer that was used, with the primer given in ABA91743, in the PCR amplification of the cleaved amplified polymorphic sequence (CAPS) marker offs10.18 of chromosome of Arabidopsis thaliana. The primer pair includes a Ddel restriction endonuclease site. An hy2-1 mutant of ecotype clandaberge sected was outcrossed with wild-type ecotype Columbia, and a mapping population was selected from F2 families with a long hypocotyl phenotype. PCR primer pairs (see ABA91735-48) for 7 CAPS clandarkers were used in a map-based cloning of the HY2 gene. The HY2 locus was initially mapped to an interval of about 66 kb between the markers emigin and F3124. Fine mapping localised the HY2 gene (see ABA91766) to 2 overlapping bacterial artificial chromosome clones, MZB10.18 and F3124.1. The HY2 gene encodes a ferredoxin-dependent biliverdin reductase, phytochromobilin synthase (see AAMS0863), that is related to a family of proteins found in oxygenic photosynthetic bacteria. HY2 is an example of Hy bilin reductases of the invention, which are useful e.g. for the conversion of biliverdin complytobilin and the assembly of holophytochromes or phytofluors. Novel isolated HY2 family bilin reductase having bilin reductase activity, useful for converting biliverdin to phytobilin, and for producing a photoactive holophytochrome and/or phytofluor -Example 1; Page 49; 102pp; English.

Transporting a polypeptide into the nucleus of a cell comprises using light to transport a polypeptide attached to the apoprotein component of a phytochrome into the nucleus -WPI; 2003-041421/03.

Montgomery BL;

Gambetta GA,

Frankenberg N,

Kochi T,

Lagarius JC,

Example 1; Page 53; 102pp; English.

The invention relates to a method for transporting a polypeptide into the

polypeptide attached to the apoprotein component of the phytochrome in a cell, and exposing the cell to light where the phytochrome migrates from the cytoplasm of the cell into the nucleus which transports the polypeptide into the nucleus. The invention also relates to regulating the transcription of a gene in response to light comprising expressing a phytochrome containing a heterologous transactivator or repressor attached to an apoprotein component of the phytochrome in a cell, and exposing the cell to light where the phytochrome migrates from the cytoplasm of the cell into the nucleus and the transactivator or repressor alters expression of a gene in the nucleus. The methods are used to transport a polypeptide into the nucleus of a cell or to regulate the transcription of a gene in response to light. This sequence represents a PCR primer used to amplify DNA used in the scope of the nucleus of a cell, comprising expressing a phytochrome comprising the invention.

Identifying individuals at increased risk of lymphoid leukemia and lymphoma - using DNA from immune receptor locus capable of displaying genomic instability

Disclosure; Page 15; 55pp; English.

The sequences given in AAQ24701-Q24713 are a set of PCR primers which are complementary to a sequence within a 2000bp inversion of chromosome 7. This inversion (inv(7) (p14q35)) is found in normal people but patients suffering from the disease ataxiatelangiectasia (AT) have a 70-100 fold increase of the T-lymphocyte specific inversion inv(7). Using these sequences a screening test has been developed which can accurately measure lymphocyte-specific genomic instability and by extrapolation thus identifies individuals at increased risk for the

```
This invention describes a novel method for identifying an inhibitor is potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is precancerous condition, by administering to the patient having a specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene
 identifying carcinogenic compounds.

Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers. For further information please visit the Derwent (Updated to two Agrwent con/dwpi/Updates/ntis_us.html.)

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is citive on a gene vital for cell growth or viability, and where the gene citive on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or

Recombinant antigenic Mycoplasma hyponeumoniae protein

Example 2; Page 23; 45pp; English

PCR primers AAX60140-41 were used to amplify DNA encoding a Mycoplasma hyopneumoniae P102 protein clone. The P102 protein and its fragments are used in vaccines to protect against enzocite pneumonia, particularly in swine. Recombinant P102 polypeptides may be used as antigens for diagnostic purposes to determine whether or not a biological test sample contains M. hyponeumoniae antigens or antibodies. The P102 polypeptides or DNA sequences may also be used for immunising or protecting non-human animals, preferably swine, against M. hyponeumoniae infections, particularly enzoctic pneumonia.

Isolated nucleic acid molecules having polymorphisms in known human genee e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits

Example 18; Page 133; 714pp; English

This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known cytochrome P450 Al (CYP4501Al), adrenergic receptor betal (ADBR1), cytochrome P450 O2E1 (CYP4501Al), adrenergic receptor betal (ADBR1), aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator (ARNT), cathepsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding inhibitor (DBI), epoxide hydroxylase 2 (EDRX2), 5-lipoxygenase activating protein (FLAP), glutathione-S-transferase 12 (GST12), histanine-N-methyl transferase (HNMT), MADPH quinone oxidoreductase 2 (MQC2), sulfotransferase thermolabile (STM), UDP-glucuronosyl transferase (UGT2B1S), multidrug resistance (UGT2B1S), urokinase receptor (MGT2B1), unltidrug resistance (MRNI), naphan nuclear receptor (MRIL2), cacety-dholine muscarinic receptor 1, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence. The polymorphisms in the human genes cited in the characterising the cones that are receptor (NT STRIZ), characterism the domes that are receptor in coating and characterising the genes that are responsible for specific traits within the genome and eventually identifying the genes responsible for a variety of disorder related traits as a result of their e.g., overexpression, constitutive expression, mutation or underexpression, which may be used in diagnosing and/or treating the disorders. The nucleic acid molecules comprising the polymorphic sequences contained in CYP4501A1, CYPP4501A2, CYP4502E1, ARNT, BPHX2, GST12, NNMT, NQO2,

à g \$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$

for screening individuals for altered drug metabolism. The polymorphic sequences contained in CYP4501A1, CYPF4501A2, AHR. MDR1 and/or MDR3 may also be used to screen individuals for succeptibility to cancer. Polymorphic sequences in ADR1 or CHMR2 are used to screen for altered cardiovascular function, in COX2 for altered susceptibility to colorectal tumours, in DBI or CHMR1 for altered central nervous system function, in FLAP and HNMT for altered bulmonary, immunological or haematological function, in TEAP and HNMT for altered serine protease activity in the prostate, in LTF for altered immunological or haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and peripheral nervous system function. The present sequence represents a PCR primer used to amplify the sequences of the invention. UGT2B4, UGT2B7, UGT2B15, AHR, MDR1 and/or MDR3 are useful

The present invention describes genetic variants of the human glutathione reductase (GSR) gene (I). (I) has antianaemic activity and can be used in gene therapy. (I) can be used in screening for drugs targeting (I) that are useful for treating haemolytic anaemia. Methods from the present invention can be used: for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with GSR activity; for haplotyping, which is also used by the pharmaceutical research scientist to validate GSR as a candidate target for treating a specific condition or disease predicted to be associated with GSR activity, e.g. haemolytic anaemia, and in the design of clinical trials for treating a specific condition of disease associated with GSR activity, and for screening compounds targeting GSR. New genetic variants of Glutathione reductase isogenes, useful for improving efficiency and reliability in drug development for treating hemolytic anemia Claim 14; Page 14; 137pp; English.

The present sequence is a primer for the PCR amplification of murine growth hormone (mGH) cDNA, which was used to transform a stem cell, which in turn was introduced into an organism to produce a transformed organism. The transformed organism exhibits increased growth, and as the growth hormone gene is expressed continuously, it can be grown very quickly. The resulting organism, specifically a mammal, shows improved body weight and milk production.

A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithalium of the subject. The present sequence is an antisense oligonucleotide specific for endothelial nitric oxide. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary inflammatory response. By eliminating adenosine from the antisense ON, its libration upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-reactive airways.
 Gaps
 Treatment of airway diseases such as asthma - by topically applying adenosine-free antisense oligo:nucleotide to airway epithelium of

```

The present invention describes a composition comprising a mixture of different species of molecules where each species is linked to a tag different species of molecules where the tags can be identified without the positions on that species and that encodes at least two variable positions on that species, where the tags can be identified without the need for first isolating each of the tags can be identification. Liquid phase hybridisation system may be used for simultaneous identification of a large subset of targets out of a very large collection of similar of dissimilar molecular species. It may also be used to create tagged peptides, antibodies, nucleic acids. Method bar codes collections or probes or analytes for use in a liquid phase hybridisation method. Tagged probes able to detect small changes or mutations in the target specimen. Use of molecular tags overcomes difficulties of prior art methods, e.g. the concentration of the probe would not be limited by the solid support, both the target nucleic acids and the probes can diffuse toward each other, and signal amplification through cycling reactions could occur. Sequencing DNA with tags in combination with DNA amplification techniques means that there is no need for traditional sequencing methods or the carget in the present sequencing methods or the areans that there have needed for traditional sequencing methods or the areans the analysed or the analysed of the analysed or the analyse from the reason is a position the property of the present sequencing method is an analyse of the analysed or the analyse from the analyse of t example from the present invention.

New antisense oligonucleotides used in treatment of, e.g. pulmonary vasoconstriction

Disclosure; Page 61; 120pp; English.

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, gene
initiation codons, genomic flanking regions, intron-exon borders, the
initiation codons, genomic flanking regions, intron-exon borders, the
cregions and all segments of RNAs encoding proteins associated with one
or more diseases, conditions or mixtures. The antisense oligonuclectides
or conditions are those AAX55180-271 can be used for the
antisense treatment of diseases and conditions. Typical diseases and
conditions are those associated with impaired respiration and
conditions are those associated with impaired respiration and
inflammation, including lung diseases, pulmonary vasoconstriction,
inflammation, respiratory distress syndrome, pain, cystic fibrosis,
crepiration, respiratory distress syndrome, pain, cystic fibrosis,
copinmonary hypertension, pulmonary vasoconstriction, emphysema, chronic
conditions as carcinomas e.g. colon cancer, breast cancer, lung cancer,
conflammatic cancer, hepatocellular carcinoma, kidney cancer, melanoma,
conflammatic metastases, as well as all types of cancers which may metastasize
conflammatized to the lungs, including breast and prostate cancer.

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with activating peptide factors and transmitters, tuch as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobuline and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adenosine molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central receptors, and peripheral nervous and non-nervous system creceptors, and peripheral nervous and non-nervous system period receptors, contral creceptors, defensins, growth factors, vasociated proteins. The antisense oligonucleotides may be used in this way to treat disorders and/or bronchoconstriction) and/or lung inflammatry obstruction and/or surfactant hypoproduction which are associated with a disease or condition selected from milmonary vasocnary inflammation, alleray(ies) condition selected from milmonary vasocnary inflammation, alleray(ies) condition selected from milmonary vasocnary inflammation, alleray(ies) condition selected from milmonary vasocnary inflammation, alleray inclination. Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polymocleotide fragments and antisense oligonucleotides used in the exemplification of Claim 14; Page 251; 1592pp; English. Low adenosine antisense oligonucleotide SEQ ID NO:1410.

vasoconstriction; asthma; Human; adenosine receptor; low adenosine antisense oligonucleotide; phosphorothioate; impaired respiration; inflammation; allergy, allergic disease; bronchoconstriction; inhibitor; antiinflammatory; antiallergic; attallergic; ortiosthmatic; cytostatic; analgesic; impaired airway; lung disease; ischaenic condition; pulmonary vasoconstriction; asthma respiratory distress syndrome; pain; cystic fibrosis; emphysema; pulmonary hypertension; chronic obstructive pulmonary disease; COPD; cancer; leukaemia; lymphoma; carcinoma; metastasis; ss

The present invention describes a new composition comprising an antisense oligonuclectide (ON) with low adenosine (up to 158), which carginates nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergie, and inflammation. The ON can have antiinflammatory, antiallergie, cuseful for the treatment of diseases associated with inflammation, effects afflict the tungs of a subject. They can be used for treating effects afflict the lungs of a subject. They can be used for treating esthmá, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary vasoconstriction, allergies, carchinomas, and cancers such as leukaemias, lymphomas, carchinomas, and cancers which may metastasise to the lungs, including the ONs reduces side effects. The reduction of the adenosine content of the ONs reduces side effects. The reduction of the adenosine content of the ornconstriction and inflammation. Adal3312 to Adal3512 represent the invention, which correspond to SEQ ID NO:1 to 2815, and then the last content on the previously named sequences listing from the present contention. Oligonuclectide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification

Claim 7; Page 43; 294pp; English.

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of ganomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin.

Tetinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKN2A), ARC, Factor VII, Factor IX, haemoglobin alpha locus apolipoprotein E (APOR), LDL receptor (LDLR), wGH2, MSH6, apolipoprotein E (APOR), LDL receptor (LDLR), uDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presentiln-1 (PSEN) and presentiln-2 (PSEN2). These can be used in the gene threspy of diseases with as connective administration of the control of the Buch as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention.

Claim 8; Page 49; 79pp; English.

AAV22531-89 represent antisense oligomucleotides which are targeted against the mRNA of the R1 subunit sequence of ribonucleotide reductase. Aberrant expression of the R2 gene, which encodes the second subunit of the ribonucleotide reductase gene, can determine the malignant of the ribonucleotide reductase gene, can determine the malignant of characteristics of cells. Suppression of R2 and R1 gene expression was conducted to reduce transformed properties of tumour cells. The antisense oligomucleotides can be used for modulating tumour cell growth, or for inhibiting tumour cell proliferation. They can also be used for increasing the sensitivity of neoplastic cells to chemotherapeutic drugs (especially to hydroxyurea, methotrexate (MTX), and PALA) The antisense cligomucleotides may be used to treat proliferative disorders including lenkamias, lymphomas, marchorexate (MTX), and pALA). The antisense clenkamias, lymphomas, astromas, melanomas, various other forms of cancer, papillomas, arthrosclerosis, psoriasis, polythemia, mastocytosis, autoimmune diseases, angiogenesis, bacterial infections and varial infections (including HIV hepatitis, or herpes infections). 0 The present sequence is an oligonucleotide used for antisense modulation of interleukin-5 (IL-5) signal transduction. Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include Mouse; interleukin-5; IL-5; signal transduction; antisense oligonucleotide; antiasthmatic; immunosuppressive; cytostatic; IL-5 receptor-alpha; asthma; eosinophilic syndrome; infection; Gaps .; 0 Antisense oligonucleotide compound used to treat asthma and eosinophilic syndrome in humans modulates interleukin-5 signal transduction -Query Match 1.3%; Score 14.4; DB 1; Length 20; Best Local Similarity 93.8%; Pred. The invention relates to isolated genes (Gene 216) from human chromosome 20p13-p12 and the proteins they encode. The nucleic acids and proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate Gene 216 expression. For example, the nucleic acids (or vectors) and proteins may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of gene 216 by expressing in a patient's genome that affect the activity of gene 216 by expressing in a patient's additionally, the nucleic acids may be used to produce the secreted Gene 216 protein. by inserting the nucleic acids into a host call and culturing the cell to express the protein. The nucleic acids secreted Gene 216 protein, by inserting the nucleic acids into a host call and culturing the cell to express the protein. The nucleic acids and opplementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples and therefore which patients may be in need of sequences in samples and therefore which patients may be in need of centual activity. The anti-Gene 216 protein may also be used as antigens in the production of antibodies against Gene 216 antibodies may also be used as antigens of the auticonity the presence of Gene 216 proteins in samples (e.g. and activity. The anti-Gene 216 antibodies may also be used as diagnosed and activity. The anti-Gene 216 antibodies may also be used as diagnosed and activity. The anti-Gene 216 antibodies may also be used as diagnosed activity and inflammatory bowel disease. The present confervity and inflammatory bowel disease. The present confervity and inflammatory bowel disease. The present confervity and inflammatory bowel disease. The gene (ABZ72067-ABZ72088), polymorphism (SSCP) analysis (ABZ72091-ABZ72081).

The invention relates to antisense compounds, compositions and methods for modulating the expression of calreticulin. The compositions comprise antisense compounds, particularly antisense oligonucleotides, targetted to nucleic acids encoding calreticulin. The antisense compound is useful for inhibiting the expression of calreticulin in human cells or tissues. It is also useful for treating a human having a disease or condition associated with calreticulin, e.g., hyperproliferative disorder e.g. cancer, autoimmume disease, viral infection or cardiovascular disease, by inhibiting expression of calreticulin. It is useful for disposities, therapeutics, prophylaxis and as research reagents and kits. It is also

used in antisense therapy. The present sequence is an antisense compound targetted to human calreticulin. This sequence is used to study the antisense inhibition of calreticulin expression-phosphorothioate 2'-MOE

Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch -

Example 5; Fig 29; 300pp; English.

The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Appergillus funigatutus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents can each onchoverva volvulus, Entamoeba histolyfica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC betecting cancer involving oncogenes, tumour suppressor genes or involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the candidative infanting (using a computer) identified ligation to a particular sites and identifying if ligation of the oligonucleotide probe cor absence of the target uncleotide sequences. ABI82074 to feature invariance in the exemplification of the invariance of the target medicals as a canding corporate invariance and correlating using a computer) identified in a manual correlation of the contraction of the exemplification. the present invention.

Use of markers (e.g. caspase-3, glial fibrillary acidic protein, and matrix metalloproteinase-9) for diagnosing stroke or transient ischemic attack, or identifying a subject as at risk for a stroke or cerebral vasospasm

Example 2; Page 61; 86pp; English.

The present invention describes a method for determining a diagnosis of stroke or transient ischaemic attack, identifying a subject as at risk for a stroke or cerebral vasospasm, or differentiating ischaemic stroke from haemorrhagic stroke in a subject, which comprises determining the presence or amount of specific marker(s) and non-specific marker(s) for cerebral injury. The method is useful for diagnosing stroke (e.g. haemorrhagic stroke) or transient ischaemic attack, identifying a subject as at risk for a stroke or cerebral vasospasm, or differentiating ischaemic stroke from haemorrhagic stroke in a subject. The method is also useful for distinguishing amongst haemorrhagic stroke, e.g., subarachnoid haemorrhage or intracerebral haemorrhage. The method is also useful for differentiating between thrombotic, embolic, lacunar or hypoperfusion, types of strokes. The present sequence represents a PCR primer for human matrix metalloproteinase 9 (MMP-9), which is used an example from the present invention.

This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula:

(X) ms^f - (alpha)n-beta-N3', or (X)ms^f - (gamma)k-delta-N3'; where

X = a labelled compound and/or a nucleotide with voluntary sequence;

m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, gamma = thymine or cytosine;

N = adenine, gamma = thymine;

k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for FT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene sequences.

 The present invention describes a bacterial cell having protection against conditions lethal to an unprotected bacterial cell, and which is obtained by subjecting a bacterial cell to treatment with a sublethal level of stress. Also described are: (1) a nutritive composition comprising bacteria having protection against conditions lethal to unprotected bacteria, and (2) a method of protecting a bacterial cell against stress by treating a bacterial cell with a sublethal level of

This invention relates to a method for measuring nucleic acids using a nucleic acid probe labelled with a fluorochrome. The nucleic acid probe decreases the fluorescence of the fluorochrome when hybridised with a target nucleic acid, the decrease in the fluorescence is measured. The method can be used for measuring a target nucleic acid.
stress consisting of thermal shock, osmotic shock, pH shock, oxidative stress. Chemical stress, nutritional stress. Wh's stress or cold stress. The new cells having protection against lethal conditions are useful in the production of fermented products and starter cultures, and in the fermentation of fmilk products. Bliddobeacteria and lactobacilli may be used in prophylaxis or treatment of ailments including gastrointestinal infections. The protected bacterial cells are more advantageous for use in large-scale processes than those unprotected cells. The present exemplification of the present invention.
 Measurement of nucleic acids, using a nucleic acid probe and analysis of the obtained data -

The invention relates to bacteriophage N4-coded virion RNA polymerase (vRNAP) and its nucleic acid. The nucleic acid is used to make an N4 vRNAP which is useful: in the synthesis of RNAs of a desired sequence. RNAs for use as probes in hybridisation studies or Southern or Northern blot analysis, and RNA:DNA hybridisation studies or Southern or Northern structure determination; for in vitro studies of splicesome assembly, splicing reactions and antisense experiments; for in vitro translation or microinjection; and for nucleic acid amplification. The present sequence is Bacteriophage N4 vRNAP gene terminator signal sequence.

 This oligomer contains an inverted polarity region formed from an o-xyloso dimer synthon. Residues 13 and 14 are linked via an o-xyloso group (i.e. nuclectides that have xylose sugar linked via the o-xylene ring). The sequence is designed to target the Human interleukin-1 beta gene beginning at nuclectide 7378 and will covalently cross-link to it via the N4N4-ethanocytosine group. See also AAQ20026-Q20030.

The sequences (AAQ53077-Q53136) are used in the invention to detect specific genes without the use of radio-isotopes. Detection is carried out by hybridisation of denatured (ss) sample DNA with a (ss) nucleic acid probe, complementary to the target sequence. Hybridisation occurs on the surface of an electrode or optical fibre and detection is visualised by the addition of an entity that recognises (ds) hybridised DNA and is electrochemically /

The invention relates to new oligonuclectide probes and primers used for the detection of human papillomaviruses (HPV) which are not genital types 6, 11, 16, 18 or 33. The probes and primers AAT44608-T44693 are esp. used to detect HPV types 26, 31, 318, 35, 39, 40, 43, 445, 51-59 and 68. The primers can be used to detect these HPV types in conjunction with the consensus primers and typing probes AAT44733-T44906, which are based on and amplify fragments of the L1, E6, E7 and E1 regions of the HPV sequences. Detection of the amplification prods. is done with probes derived from consensus sequences found in all characterised HPV sequences. Primers AAT44751-2 are used to amplify a fragment of the hghly divergent isolate HPV sequences have been successfully amplified in the reaction.

Selection of sets of tag nucleic acids and generation of probe arrays - for simultaneous detection of large numbers of nucleic acids in a sample

WPI; 1997-482677/45.

Example 3; Fig 4; 46pp; English.

=

method has been developed of selecting tag nucleic acids (TNA) with minal hybridization to a nucleic acid. A composition has also been developed comprising a set of TNA with a constant region and a variable region, optionally with < 2 c nucleotides, where the variable region are to probe NA, and preferably contains an even number of A+G nucleotides, and preferably contains an even number of A+G nucleotides, each TNA when aligned with any other TNA of the set comprising several experimental objection of oligonucleotide probes comprising substrate, where each set hybridises to a different target NA under stringent hybridisation conditions, each oligonucleotide probe of a solid substrate, where each set hybridises to a different target NA under stringent hybridisation conditions, each oligonucleotide probe in cross hybridise in the array, is also new. The present sequence cross hybridise in the array is also new. The present sequence represents an auxotrophic ORF 20mer tag, which is used in an example of the present invention. The method of synthesising the TNA's and probes are designated Very Large Scale Immobilised Polymer Synthesis of all the components, especially nucleic acids, in a mixture in a single assay.

New oligonucleotide primers amplifying gene regions conserved among mammals - useful for developing genomic maps, isolating clones and making cross-species comparisons Claim 1; Page 11; 26pp; English.

The present sequence represents a specifically claimed oligonucleotide PCR primer. The oligonucleotide can be used for polymerase chain reaction (PCR) amplification of DNA, specifically regions of specific genes that are conserved among mammalian species, i.e. pairs of oligonucleotides from the present specification represent universal mammalian sequence-tagged site (UM-STS) primers. The primers are used

Claim 25; Column 29; 20pp; English.

detect mutated codon

A new method has been produced for the detection of an activated rass gene containing a mutated codon. The method involves: either cleaving a human subject 's genomic DNA with a restriction enzyme to produce DNA common subject 's genomic DNA with a restriction enzyme to produce DNA molecules or isolating the subject's polyA+ mRNA; contacting the single-stranded DNA molecules or polyA+ mRNA under hybridising conditions with a labelled synthetic DNA molecule, optionally bound to a solid support, comprising 12-20 nuclectides, where the synthetic DNA complementary to 5'-B-Q-D-3' in the case of single-stranded DNA or is complementary to 5'-B-Q-D-3' in the case of polyA+ mRNA, B = 0-9 nuclectides having a sequence complementary to a sequence in the activated ras gene 5' of the mutated codon, D = 0-12 nuclectides having a sequence complementary to a sequence in the activated ras gene 5' of the mutated codon, D = 0-12 nuclectides having can sequence in the activated ras gene 5' of the mutated codon, D = 0-12 nuclectides having can sequence in the activated ras gene 5' of the mutated codon, D = 0-12 nuclectides having can sequence in the mutated codon, provided that B and D contain a total of at least 9 cuclectides, and Q is complementary to the mutated codon; treating the result of complementary molecules to remain hybridised molecules to remain hybridised molecules complementary molecules to remain hybridised molecules. The present squence represents the synthetic DNA probe used for detecting the activated N-ras gene when the mutated codon is at position 61 and

 This sequence represents a probe for the N-ras gene, that can be used in the method of the invention. The method is for for detecting a mutation from a non-mutated sequence of a target polynucleotide (TP) in a sample, by using a mismatch binding protein (MBP), comprises:

(a) providing a non-mutated and mutated TP; (b) forming duplex of the non-mutated and mutated TP; (b) forming duplex of the non-mutated and mutated the polynucleotide from (a); (c) adding a single strand binding protein to the polynucleotide from (b); (d) incubating MBP with an activating agent; (e) adding the incubated MBP from (d) to the polynucleotide from (c), so that MBP binds to the duplex formed by one polynucleotide from (c), so that MBP binds to the duplex formed by one presence of any MBP bound to TP. The method may be used for early diagnosis of cancer. Binding of MBP to single strands is inhibited by the single strand binding protein. By activating MBP with an activator, minimal and the sample, binding to double strands lacking

Protein containing PDZ domain, whose expression is enhanced by TNF stimulation - plays an important role in protein/protein interactions and is used for screening for proteins for use in treatment of cell proliferation disorders such as cancer

Example 2; Page 29; 240pp; Japanese.

This sequence represents a primer use to amplify and isolate clones which encode new proteins containing PDZ domains whose expression in human umbilical vascular endothelial cells (HUVEC) are enhanced by stimulation with tumour necrosis factor (TNP) alpha. The new protein is used to identify proteins which bind to it (particularly to the PDZ domains) and the genes encoding them, for use in the treatment of cell proliferation disorders such as cancer.

 AAV73026-V73071 are probes used to detect a single-base mutation in a human ras oncogene. These probes comprise 12-43 nucleotides of formula 5'-B-Q-D-3', Q = 3 nucleotides complementary to the mutated codon, and B and D each = 0-20 nucleotides complementary to the ras sequences flanking the mutated codon. The probes are useful for detecting cancers associated with point mutations.

The present invention describes an antisense compound (I), 8 to 30 nucleobases in length, that is targeted to a nucleic acid molecule concoling STATA (Signal Transducer and Activator of Transcription) and which inhibits the expression of it. (I) has antinflammatory, continibiting the expression of STATA in cells or tissues, treating antinhibiting the expression of STATA in cells or tissues, treating an animal having a disease or condition associated with STATA or a spoptosis, and inducing apoptosis in a cell. Diseases or conditions that are treated are rheumatoid arthritis, cancer of the breast, concerts, brain, head and/or neck, leukaemia, myeloma or prostate, brain, head and/or neck, leukaemia, myeloma or conditions and concerning the role of STATA: (I) can also be used for diagnostic methods in detecting and etermining the role of STATA: (I) can be used alone or with other drugs as infmunostimulator. (I) is used in sandwich and colourimetric assays, convoluting enzyme conjugation and radiolabeling and is used in andwich and colourimetric assays, diagnostic kits. AAC93150 encodes human STATA and AAC93231 encodes mouse configence or an involving enzyme conjugation and radiolabeling and is used in the exemplification of the present invention. AAC93151 confisense oligonucleentdes, and AAC93230 represents animated confined confined confidence of involving encodes human STATA and AAC93231 encodes mouse configence of involving encodes human STATA and AAC93231 encodes mouse configence of involving encodes human STATA and AAC93231 and and AAC93231 confidence of involving encodes human stata animate confidence of information and radiolabeling and animate in the exemplification of the present invention. The present invention relates to antirheumatic agents which comprise as active ingredients an immunoglobulin M (IgM) protein. The IgM protein does not include a J segment, has apoptosis inducing activity, and consists of a light and heavy chain polypeptide produced synthetically. The agents of the invention exhibit antirheumatic and immunosuppressive Anti-human Fas humanizing antibody-containing antirheumatic agents Example 4; Page 21; 109pp; Japanese.

activity and can be used to treat autoimmune diseases, especially rheumatism. The IgM molecule used in the invention has human Fas-antigen binding properties. Included in the invention are nucleotide sequences of the IgM light and heavy chains (see AAA78267-A78272) and the corresponding protein sequences (see AAA12913-B1291) and AAB12919), and corresponding protein sequences (see AAA12913-B1291) and AAA18205-A78206) and protein sequences (see AAB12903-B12910), Also included are anti-human Fas antibody CDR peptides (AAB12902-B12907). The anti-human Fas antibody, light, heavy and kappa chains used in the invention are represented by sequences AAA78213-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A7

Oligonucleotide for treating diseases associated with human tumour necrosis factor-alpha (INFalpha) such as, diabetes and rheumatoid arthritis, comprises nucleotide sequence complementary to intron of nucleic acid encoding TNFalpha

This sequence represents an antisense oligonucleotide sequence which targets a region of the human tumour necrosis factor alpha (TNFalpha) nucleotide sequence. TNFalpha is an important cytokine that plays a role in host defence. It is produced mainly in macrophages and monocytes in response to infection, invasion, injury or inflammation. Overexpression

```
of TNFalpha can result in disease states, particularly in infectious, inflammatory and autoimmune diseases. The invention relates to antisense oligomucleotides, such as that represented by the present sequence which are capable of modulating the TNFalpha gene expression. The oligomucleotides optionally have a phosphorothicate backbone, and may also optionally contain at least one 2'-0-methoxyethyl modification. The oligomucleotides are useful for modulating the expression of human TNFalpha in cells and tissues, reducing a human cell inflammatory when the sponse, reducing the blood glucose level in a human and treating a human laving a disease or condition associated with TNFalpha. Examples of diseases associated with TNFalpha include diabetes, inflammatory bowel
 disease, multiple sclerosis, pancreatitis, rheumatoid arthritis, infectious disease, hepatitis, atopic dermatitis or allograft rejection. The antisense oligomucleotides are also useful for modulating the function of a selected nucleic acid sequence in adipose tissue.

Novel myocardium protein-7 polynucleotides, used to modulate a variety cellular processes

Example 2; Page 94; 116pp; English.

The present sequence is the reverse PCR primer designed from 3'UTR sequence of myocardium protein-7 (MP-7). This was used in PCR mapping studies to determine the chromosomal localisation of MP-7 gene. Specific amplification was carried on human and hamster cell line DNA. MP-7 is used to modulate a variety of cellular processes e.g. modulating the activity of proteins involved in cardiovascular disorders like congestive heart failure or cardiomyopathy.

PCR primers AAZ56049-Z56050 are used to amplify beta-actin from wild type and NFATP-/- cartilage cultures. The primers are used in the identification of the role that NFATP plays in cartilage cell growth and differentiation. The modulation of growth or differentiation of cartilage can be carried out through contacting cells deficient in the NFATP greates, with a test compound. Modulating growth or differentiation of cartilage cells can exhibed by contacting the cells with a modulator of NFATP activity, where the modulator comprises a peptidic compound derived from the calcineurin interacting region of NFATP. The methods of the invention are useful for modulating the growth or differentiation of cartilage cells and endochondral ossification of differentiation of cartilage cells and endochondral ossification humans, monkeys, dogg, cate, mice etc. The compound that modulates cartilage cell growth and differentiation is useful for diagnosing cartilage cell growth and differentiation is useful for diagnosing conforma, enchondroma, chondroblastoma, osteoblastoma, fibrous disponsing conformation in the expression of NFATP in cartilage cell. NFATP inhibitory compounds are useful for treating disorders such as thematolia arthritis, compounds are useful for treating disorders such as thematolia arthritis, or expense.

The invention relates to an antisense compound 8 to 30 nucleobases in length targetted to a nucleic acid encoding glycogen synthase kinase 3 alpha. The antisense compound specifically hybridises with and inhibits the expression of glycogen synthase kinase 3 alpha. The antisense compound is useful for the treatment of a diseases associated with glycogen synthase kinase 3 alpha such as diabetes, a neurological disorder, a haematopoletic disorder, a hyperproliferative disorder or a developmental disorder. The antisense compounds may also be used prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence is a phosphorothioate antisense oligonucleotide targetted to human glycogen synthase kinase 3 alpha DNA.

Amplifying nucleic acids with base sequences of mRNAs in sample while sustaining the ratio among them used to monitor mRNA expression, applicable in producing e.g. cRNA library and DNA microarrays

Example 1; Page 53; 67pp; Japanese.

DNA The present invention describes a method of amplifying nucleic acids, prime linvolving forming a single-stranded DNA to an mRNA in a sample with a primer, synthesising a DNA strand complementary to the single-stranded adapter DNA to form a double-stranded DNA, adding a single or double-stranded adapter DNA to the double-stranded DNA, and amplifying the DNA strand using a second primer with a nucleic acid sequence in the adapter DNA. This can be used to amplify nucleic acids to monitor mRNA expression, which is applicable in producing e.g. cRNA libraries, of microarrays or membrane arrays in gene engineering and gene expression analysis, and in drug development and health maintenance and management. The present sequence is a PCR primer described in the exemplification of the invention. · 0

The invention relates to a method for detecting cancerous cells in a vertebrate sample. The method comprises determining aberrant expression of the Slug gene, relative to a normal control sample. The method is used to detect (for diagnosis, monitoring progression and detection of residual disease after treatment) mesenchymal cancer cells (leukaemia or sarcoma) in humans. Agents that inhibit Slug (at DNA, RNA or protein levels) are potential antitummour agents. The polynucleotides of the invention can be used in antisense therapy. This polynucleotide sequence represents an oligonucleotide relating to the Slug gene of the invention.
 Detecting cancerous cells, useful for diagnosis and prognosis, comprises measuring abnormally high expression of the Slug gene or its

 The present invention relates to novel antisense compounds which inhibit the expression of phospholipase A2 (PLA2), group VI (Ca2+-independent). The invention is useful for inhibiting the expression of PLA2, group VI (Ca2+-independent) in human cells or tissues and for treating an animal, particularly a human suspected of having or being prone to a disease or condition associated with expression of human PLA2, group VI (Ca2+-independent). It is useful for diagnostics, therapeutics and as research independent). It is useful for prevent or delay infection, tumour formation or inflammation. The present DNA sequence is an antisense oligonucleotide targetted to human PLA2, group VI (Ca2+-independent) DNA.
 Novel antisense compounds useful for inhibiting gene expression of human phospholipase A2, group VI and for treating diseases associated with expression of phospholipase A2, group VI

Watt AT;

The invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule (II) encoding RAIDD which is an adaptor molecule containing both death domain (DD) and caspase recruitment domains (CARD), where (I) specifically hybridises with and inhibite expression of RAIDD, or specifically hybridises with at least of an active site on (II). (I) is useful for inhibiting the expression of RAIDD (Receptor interacting protein (RIP) associated ICH-1/CED-3-homologous protein with death domain) in cells or issues, and for treating an animal having a disease or condition associated with RAIDD, where the disease or condition is a hyperproliferative disorder such as cancer, or a growth or metabolic disorder. (I) is also useful for disappostics, therappettics, prophylaxis, as research reagents and kits, for distinguishing functions of various members of a biological pathway, and in antisense gene therapy. (I) is also useful prophylactically, e.g. to prevent or delay infection, also useful prophylactically, e.g. to prevent or delay infection, and continue and the match or tumour formation. Modulating anglogenesis and an immune response in an individual, for treating a hypoxic or ischemic condition, comprises administering a compound that modulates the activity of a signal transducer and activator of transcription 3 

Disclosure; Page 32; 94pp; English.

The invention relates to a method of modulating angiogenesis and immune response. Method involves administering to an individual a compound that modulate the activity of signal transducer and activator of transcription 3.0 (Stat3). Modulating angiogenesis is useful for treating or preventing hypoxic or ischaemic condition or disorder which is the result of stroke, ischaemia, notionary atherosclerosis, myocardial infarction, inflammation, tisque ischaemia in the lower extremities, infarction, crauma, vascular occlusion, prenatal or postnatal oxygen deprivation, suffocation, shock, chronic obstructive pulmonary disease, choking, asphyxia, hypoglycaemia, epilepsy, emphysema, adult respiratory distress syndrome, cardiac arrest, nitrogen necrosis, proliferative angiopathy e.g. diabetic microangiopathy with neovascularisation. Suppressing an immune response is useful for ameliorating a symptom of an autoimmune disease such as systemic lupus erythermatoms. gluten-sensitive enteropathy, autoimmune neutropenia, myasthenia gravis, idiopathic thrombocytopenia purpura, Grave's disease, Goodpasture's disease, theumatoid arthritis, cirrhosis, pemphigus vulgaris, autoimmune infertility, bullous pemphigoid, discoid lupus, ulcerative colitis and dense deposit disease. The method is useful in preventing or treating specific proliferative and oncogenic disease which includes sarcomas and Sjogren's syndrome, scleroderma, polymyositis, chronic active hepatitis, mixed connective tissue disease, primary biliary cirrhosis, pernicious anaemia, autoimmune thyroiditis, idiopathic Addison's disease, vitiligo,

Preventing and treating hepatitis viral infection in a mammal, comprises administering nucleic acid molecules that up- or down-regulate in hepatitis B virus infection or polypeptides encoded by the nucleic acid molecules

Disclosure; Page 78; 125pp; English.

The present invention relates to a method for preventing, treating, modulating or ameliorating a medical condition. The method involves administering one or more nucleic acid molecules up- or down-regulated in hepatitis B virus (HBV) infection or polypeptides encoded by the nucleic acid molecules or antibodies that bind to the polypeptide. The nucleic acid molecules or ameliorating a method is useful for preventing, reating, modulating or ameliorating a medical condition. It is also useful for determining the presence or alteration in expression of the polypeptide which is useful for the diagnosis of hepatitis viral infection. The method is useful for the diagnosis of hepatitis viral infection (e.g., acute hepatitis viral infection and a gene expression profile is useful for identifying polypeptides and polynucleotides which are associated with hepatitis viral infection. Sequences of the invention profile is useful for identifying polypeptides and polynucleotides which are useful as a diagnostic markers for HBV infection and for treating useful as a diagnostic markers for HBV infection and for treating infectious diseases. The present DNA sequence is a PCN primer which is specific for DST (digital sequence analysis) CHSI\_23 cDNA.

(such as blood, pancreas or tongue) for sequence variations of the SACI gene. A sequence variation of the SACI locus may indicate a predisposition to diabetee, obesity and/or alcoholism and may provide a diagnostic mark. The polynucleotide can be detected in a biological sample by contacting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and mouse SACI polypeptides and PCR primers specific for the SCAI genes.

New pancreatic progenitor 1 gene and polypeptide, useful for treating disorders associated with the protein defects

Example 1; Page 20; 37pp; English

The invention relates to an isolated polynucleotide (other than a naturally occurring chromosome) comprising a sequence encoding a pancreatic progenitor 1 (PPI) protein. The invention also discloses antibodies raised against the protein, expression cassettes comprising the polynucleotide and a non-human transgenic animal expressing PPI. The protein is useful for screening for modulators of PPI. The polynucleotide is useful for identifying homologous or related genes, in producing compositions that modulate the expression or function of its encoded protein, PPI for gene therapy, mapping functional regions of the protein, and in studying associated physiological pathways. An islet cell transformed with the expression cassette is useful in transplantation to provide a recipient with pancreatic islet cells, including insulin producing beta cells, for drug screening, experimental models of islet differentiation and interaction with other differentiation factors, and to additionally characterise genes involved in islet development and regulation. The polynucleotide and ppl protein are useful for analysing a patient sample for the expression of PP1, or their variants. PP1 genes, gene fragments, its encoded proteins associated with PP1 defects e.g. type I diabetes. The present sequence is a PCR primer used to isolate a nucleic acid molecule encoding PP1.

Novel antisense compound useful for treating and diagnosing fulfilammatory diseases and cancers, is targeted to a nucleic acid molecule encoding signal transducer and activator of transcription proteins -

Example 2; Page 13; 21pp; English.

Consideration of STAT3. The antisense sequences are useful for inhibiting the expression of STAT3, where the antisense compounds inhibit the expression of STAT3. The antisense sequences are useful for inhibiting the expression of STAT3 in cells or tissues, inducing Fas-mediated apoptosis in cells, and sensitising cells to apoptosis. They are also useful for treating an animal having a disease or condition as essociated with STAT3. These disorders include inflammatory or autoimmune disease, particularly rheumatoid arthritis, cancers, such as those of the breast, prostate, brain and head and neck and leukaemias, myelomas, melanomas and lymphomas. Also treatable are human diseases or conditions characterised by a reduction in apoptosis or an insensitivity to apoptotic signals. The sequences of the invention can be used in clinical research, for detecting and determining the role of STAT3 in various cell functions and physiological processes and for diagnosing conditions associated with the expression of STAT3. The sequences represent CDNA encoding human STAT3 and human STAT3 oligonucleotides. The invention relates to antisense compounds targeted to a nucleic acid

the person of the human mu-opioid receptor (hMOR). This opioid receptor belongs to the human mu-opioid receptor (hMOR). This opioid receptor belongs to the d-protein coupled receptor (GPCR) family. The amplified fragment was used to produce a GPCR array of the invention. The specification describes a GPCR array comprising a multiplicity of individual produces stably associated with a surface and a solid support. The individual GPCR polymucleotide spot comprises a GPCR polymucleotide composition consisting a non-conserved region of a GPCR polymucleotide family member. The GPCR produced family member. The GPCR produced family member. The GPCR produced family member is useful for determining the pathogenesis of different inn-related conditions or diseases in humans, e.g. asthma, disbetes, ADDS, allergies, arthritis, depression, marcolepsy, viral or parasitic infections, transplant rejection, lupus, hepatitis, autism, cancer, renal disorders,

The sequence is that of a bovine microsatellite sequence obtd. by secreting a genomic library of bovine MboI DNA fragments of between 250 and 500 bp with an (ACI)5 and a (TC)15 oligomucleotide probe.
Cone out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6) my microsatellites in the bovine genome is estimated at >100, on. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program opportunity). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait traits esp. in cattle, to allow selective breeding.

This is a 3' poly(T) PCR primer used in the amplification of the inducible cytochrome P450RAI gene which specifically metabolises a derivative of the retinoic acid (RA). The cytochrome P450 gene in general produces enzymes involved in the oxidative metabolism of endogenous and exogenous compounds. The cytochrome P450 nucleotide sequence can be used to induce or suppress the expression of its protein. P450RAI is highly induced by RA in cell lines and tissues. This allows for the development of a drug screen using promoters and nucleotide sequences to identify drugs which are useful for reducing

Retinoid metabolising protein - useful to develop products to treat, e.g. cancer, actinic keratosis, oral leukoplakia, acne, psoriasis or ichthyosis Page 14; 110pp; English

PolyT oligonucleotides (see AAV12217-28) were used in reverse transcription reactions on polyA+ RNA isolated from the fins of control or retinoic acid-treated zebrafish (Danio rerio). Several combinations of the polyT primers were used with degenerate upstream primers (see AAV12229-33) for differential display PCR. Bands demonstrating reproducible differential amplifications were found using the primers given in AAV12221 and AAV12231. This PCR product was reamplified (see AAV12234-35). A differential display product (see AAV12213) which exhibited a dependence on the presence of retinoic acid for its expression was isolated, and was used to isolate a full-length clone (see AAV12231) coding for an overland of the control of the contr retinoid metabolising protein (see AAW44159), designated zP450RAI Length 14; Sequence 14 BP; 2 A; 0 C; 0 G; 12 T; 0 other; Query Match

Optical detection of hybridization complexes for specific target nucleic acid sequences

Example 1; Page 40; 46pp; English.

This invention describes a novel method for the visual detection of target nucleic acid presence in a sample. A preferred target is a Mycobacterium complex nucleic acid sequence. The detection method uses visual detection of a change in the hybridization without aid of instrumentation. Multiple copies of a target nucleic acid sequence are mixed with first and second detectable probes under hybridizing conditions favouring particle agglutination via a bridging molecule allowing for visual detection of the target nucleic acid sequence. The

bridging molecule enhances or inhibits formation of a hybridization complex. 88888

Newly isolated nucleic acid molecule (designated p23) encoding a p23 polypeptide - useful for inducing a senescence phenotype in a cell

Example 1; Page 18; 44pp; English.

The present invention describes human senescence factor p23. An expression vector for p23 is useful for inducing a senescent phenotype of a cell (preferably eukaryotic). This may help in regulating diseases, including cancer, persistent inflammation, and various proliferative and degenerative disorders. These transgenic cells are useful in gene cherating cancer, particularly where antisense coligonucleotides are useful for blocking normal or mutant p23 expression in cancer cells or other proliferating cells. Transgenic cells are also in cancer cells or other proliferating cells. Transgenic cells are also cuseful for raising antiserum against p23, and for antibodies are useful for raising antiserum against p23, and for identifying senescent cells in culture and tissue biopsies. The p23 polymorleotides are useful for modulating or altering p23 activity in a cell, and for identifying and isolating the whole gene encoding p23, and variants of p23. Assays based on p23 elements, which detect p23 and variants of p23. Assays based on p23 elements, which detect p23 clevels and activity are useful as diagnostic markers for staging tumours, cell ements also provide an assay for detecting chromosomal rearrangements in chromosome 3 in a human cell. The isolation of the p23 polynucleotide celements a primer used in an example from the present

The present sequence represents a potential triple-helix forming region. It can be used to demonstrate the assay of the invention. The assay comprises adding a sample containing double-stranded DNA test sequences, e.g. containing the present sequence, to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and designed to form a tripler a part of the anchor DNA or reporter DNA is sequence. Triplex formation results in displacement of the test which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detection of oncogenes and Hepatitis B virus.

New conformationally restricted 3',5'-bridged nucleosides and oligonucleotides useful as antisense therapeutics or as gene-specific diagnostics

Example 20; Column 16; 10pp; English.

The present sequence is an oligonucleotide containing 3'-C-amino-5'(\$)-C,3'-N-ethanothymidine, a bicyclic-sugar nucleoside. All nucleotides in the sequence were incorporated by phosphoramidite chemistry using a DNA synthesiser. Bicyclic sugar nucleosides are conformationally restricted 3',5'-bridged nucleosides which can be used produced that have certain, desired, geometrical shapes and entropy accellent biological stability. The conformationally-modified oligonucleotides may be useful as antisense inhibitors of gene expression or as gene probes, and may therefore be used in antisense therapeutics or gene-specific diagnostics

Light-responsive oligonucleotides, useful in controlling DNA synthesis and gene expression, have structural isomerization on irradiation, and reversible change in melting temperature of the formed double or triple

Example 3; Page 20; 43pp; Japanese.

The present invention relates to light responsive oligonuclectide, which contain one or more organic groups which can undergo structural slomerisation upon irradiation at a specific wavelength. The melting temperature of a double-strand formed by the light-responsive oligonuclectide, and another oligonuclectide complementary to the infahr-responsive oligonuclectide, reversibly changes depending on light irradiation. The oligonuclectides are useful in bit echonology, e.g. in controlling DNA elongation, gene expression, ampification and transcription, and for efficient gene diagnosis and gene therapy. The present sequence is an oligonuclectide used in the present invention.

The present invention relates to an oligomer comprising L-ribo-configurated Locked Nucleoside Analogues (L-ribo-LNA analogues). The present sequence is an RNA oligomuclectide. Binding studies of the L-ribo-LNA analogues towards the present sequence were carried out, to determine the thermostability of the L-ribo-LNA analogues. The analog of the present invention have a variety of uses e.g. in the preparation of conjugates of the L-ribo-LNA modified oligonucleotides (oligomers). Score 14; DB 1; Length 14; Pred. Construction of cDNA tags for identifying expressed genes with specific linkers and recognition sequences, applicable in gene expression analysis, disease diagnosis and identifying target for gene therapy -

The present invention describes a method for constructing a cDNA tag for identifying an expressed gene. The method comprises: (a) preparation of complementary deoxyribonucleic acid; (b) producing cDNA fragment by cleavage with II type restriction enzyme; (c) obtaining a linker X-CDNA fragment ligated material; and (e) cleaving the amplification product. The method can be used for the construction of cDNA tags for identifying expressed genes, which is applicable in gene expression analysis, disease claimosts and identifying target for gene therapy, including the claimosts and identifying target for gene therapy, including the claimosts and identifying target for gene therapy, including the claimost of difference in function or morphology of cells under physically expressed, with reproducibility and accuracy in the detection of genes. The present sequence represents an expressed gene claiming from the recovery of the recovery for an example from the present invention.

 The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HRR2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rhemmatic activity. The nucleic acid molecules are useful for reducing HRR2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ55889 - ABZ65216, ABZ6444 - ABZ65531, BAZ66520 - ABZ66520 - ABZ66585 represent substrate/target sequences for the human ribozymes of the invention.

 The 3' end of this oligonuclectide carries 1,3-propanediol. The oligo is one of four oligonuclectides which were designed to AAQ20004. Oligo #3 has a covalent cross-linking group, i.e. NA42-ethanocytosine, at its 5' and 3'-ends. An assay for crosslinked triple helix showed the most complete reaction with oligo #3. A control oligo with no cross-linking group showed no reaction while Oligos #1 (see AAQ20005) and #2 (AAQ20006) with the crosslinking group at the 5' and 3' ends, respectively, showed considerable reaction. An oligonuclectide with NAN4 ethanocytosine within its sequence (see AAQ20008) showed less effective binding.
 New sequence-specific non-photo-activated crosslinking agents -
bind to the major groove of duplex DNA and are esp. useful for
treating latent infections e.g. HIV

The sequence is that of the hybridising region of tailed probe DRB98 for use in a method for determining HLA-DR beta sub-type in a nucleic acid example. The method allows specific nucleic acid sequences of the second exon of HLA-DR beta genes to be amplified then probed for identification of polymorphic sequences. The amplified DNA is useful for typing homozogous or heterozygous samples from a variety of sources and for detecting allelic variants not distinguishable by serological methods. The typing system can be used in a reverse dot blot format which is simple and rapid to perform, produces detectable signals in minutes and identifying disease susceptible individuals.

The present invention describes a novel enzymatic nucleic acid (ENA) having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues; (ii) a 2 '-C-allyl modification at position 4 of the ENA; (iii) at least ten 2'-O-methyl modifications; and (iv) a 3 '-end modification. The ENA's can inhibit collagenase and stronelysin production in the Synovial membrane of joints for the treatment or prevention of arthritis, particularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance of a recipient to an alloantigen of a donor. They can also be used for charance or for treating autoimmune disease, and for treating allerance or for treating autoimmune disease, and for treating allerance or for treating autoimmune disease, and for treating allerance without inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of stronelysin without introducing the non-specific effects upon gene expression which accompany treatment with restnoids and dexamethasone. The concentration of tibozyme required to affect a therapeutic treatment concentration of tibozyme required to affect a therapeutic treatment concentration of tibozyme required to affect a therapeutic treatment concentration of the present sequence is used in the exemplification of the

The present sequence is an example of a complementary sense strand from a novel DNA sequencing oligonucleotide called a "prinker" (primer/linker), which comprises a prining site, labelling region, cohesive end and complementary strand. The priming site is the optimal target for annealing prior to treatment with polymerase. The labelling region is a template sequence which directs DNA polymerase to incorporate multiple labelled, e.g. radioactive nucleotides. The cohesive end provides compatible ends for ligation of prinkers to restriction fragments. The complementary strand provides a region of double stranded DNA which is required by DNA ligases for the attachment of the prinker to a restriction fragment. A prefd. sequencing procedure comprises the generation of restriction fragments from the DNA mol. to be sequenced, ligation of prinkers to the fragments, sepn. and purificn. of prinker attached restriction fragments, conc. and buffer exchange, Disclosure; Page 5; 23pp; English.

New oligo:nuclectide(s) for DNA sequencing - having a priming site, a labelling region and a cohesive end complementary to a restriction

 AATI6392-T16429 represent amplification primers for the human obesity polypeptide (DBP) gene sequence (see AATI6373). These sequences were used to amplify the OBP gene sequence from the YAC contrig containing the human OBP gene, in a series of sequence tagged-site (STS)-specific PCR assays. There were 19 STSB found within the YAC contig human OBP gene equence. This sequence was used in conjuncture with AATI6418 to amplify the STS sWSS1392. OBP has effects on both food intake and energy the STS sWSS1392. OBP has effects on both food intake and energy coptionally combined with Known medicaments), for modifying diabetes, high

 Classifying patients with inflammatory disease, specifically asthma - according to polymorphisms in 5-lipoxygenase gene regulatory region, e.g. to identify candidates for lipoxygenase inhibitor
 The present sequence was used in the development of a novel method of classifying patients suffering from an infilamentory disease. The method comprises identifying in DNA from at least 1 patient a sequence polymorphism, as compared with the normal 5-lipoxygenase [5-LOX] game (APAT88431), in a 5-LOX regulatory gene Sequence. The method can be applied to subjects with asthma, ulcerative colitis, bronchitis, sinusitis, psoriasis, allergic and mon-allergic rainitiss, luque or theumatoid arthritis. Specifically it can be used to diagnose asthma or susceptibility to disease, identify treatments suitable for individual patients or assess the

Identifying compounds which modulate expression of nucleic acids, used to provide compounds having defined physical, chemical or bioactive properties, e.g. antisense activity

Example 30; Page 113; 264pp; English.

A method has been developed of defining a set of compounds that modulate the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of defining a set of oligonucleotides (ONs) that modulate the expression of

Ξ

a tNA sequence via binding of the ONs with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria, and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined physical, chemical or bioactive properties. Information gathered from assays of such compounds is used to identify nucleic acid sequences that er tractable to a variety of nucleotide sequence-based technologies, e.g. antisense drug discovery and target validation. AAZ40852 to AAZ41220, and AAX22701 to AAX22706, represent sequences used in the exemplification of the present invention.

This sequence represents a PCR primer for DNA encoding the Pax4 protein. The invention relates to a method for testing the developmental status of the pancreatic cells of a mammal comprising: (a) determining the level or status of Pax4 mRNA and/or protein in the pancreatic cells; and (b) comparing the level to the corresponding level in normal pancreatic cells. The method can further comprise detecting the level or status of Pax6 mRNA and/or protein in the pancreatic cells. The method is useful for the diagnosis and detection of diseases which arise from certain pancreatic cells. Sepecially diabetes, e.g. juvenile diabetes, diabetes mellitus, and hormone secreting tumours.

```
The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell comprises: (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family, and (c) calculating a proximity index using a selected gene family, and (c) calculating a characterising cells, e.g. for determining the methods can be used for centracterising cells, e.g. for determining the origin of a cell, its characterising cells, whether it carries a genetic defect, or whether it is considered. They can be used for determining the an individual, e.g. a fetus. They can also be used for determining the containing cells capable of expressing an homeobox related desired containing cells capable of expressing an homeobox related desired containing cells capable of expressing an homeobox related desired containing cells capable of expressing an expression in a selected gene family. Sequences AAZ17803-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be eslected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 erzyme genes, steroid

This sequence represents a PCR primer for human Syk kinase. The invention relates to a method for inhibiting the signal transduction of the gamma subunit of the igs receptor Fo epsilon RI, using a peptide inhibitor, or an antisense construct. The invention also relates to a method of inhibiting the release of a mediator from a Syk-producing cell of a mammal, and a method of inhibiting the phagocytic potential of a mammalian cell expressing an Fo receptor, The methods are useful for modulating the activation of immunological processes involving Fc receptor activation, especially asthma.
 AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their

 The present sequence is a PCR primer which was used in an invention relating to the control of body weight of animals including humans. Nucleic acids of at least 10 nucleotides which are hybridisable to a non-coding region of an OB nucleic acid have been created. The OB gene plays a critical role in the regulation of body weight and adiposity. The nucleic acids may be used as probes or as primers for PCR. They are useful for evaluating the presence of mutations in the human OB gene or for evaluating the level of expression of OB mRNA. Defects associated with OB gene expression result in obese phenotypes.

 The present sequence is a PCR primer which was used in an invention relating to the control of body weight of animals including humans. Antibodies against the mammalian obesity (OB) polypeptide have been identified. The antibodies are useful for modulating the activity of OB to control body weight and fat content and/or to treat certain pathological conditions in which there is abnormal depression or elevation of body weight. The antibodies are used to treat weight loss associated with cancer, AIDS and anorexia nervosa. They are useful for the diagnosis of nutritional disorders such as obesity and diseases associated with obesity, such as hypertension, heart disease and Type II diabetes. The kits are used to determine the presence or amount of OB in the blood or plasma of an individual.

The human Zsig24 gene encodes a membrane associated protein, and is linked to defects in glucose metabolism. The gene has been mapped to chromosome 11q23-24. The nucleic acids and the proteins they encode may be used to screen for defects in chromosome 11 that are associated with glucose metabolism and therefore may be involved in the development of obseity and diabetes. For example the peptides may be used to produce antibodies that may be used in immunoassays and the nucleic acids may be used as probes/primers for polymerase chain reaction analysis.
 Zsig24 nucleic acids and peptides useful for detecting chromosome 11 abnormalities associated with glucose metabolism such as diabetes and

 The present sequence is that of PCR primer Syk-M, which corresponds to nucleotides 550-564 of human Syk mRNA. Syk-M was used with primer Syk-H (see AAH26690) in the PCR amplification of human Syk cDNA derived from monocyte mRNA. Experiments were performed to compare the efficacy of linear and stem-loop antisense performed to compare the efficacy of linear and stem-loop antisense cligonucleotides (see AAH26601), targeted to Syk mRNA, for reducing the level of phagocytosis from cultured monocytes; Syk tyrosine kinase is a major signal transducer for Pc-Gamma-RIIA climed action of inhibiting the release of a mediator from a claimed method of inhibiting the release of a mediator from a Syk-producing cell. This involves introducing into the cell an Syk-producing cell. This involves introducing sequence such that inhibition is effected. The cell is preferably present in the lung of an asthma patient. Also claimed is a method of treating an entisense construct that targets by administering an antisense construct that targets Syk encoding sequences and inhibits Syk
represent primers used in the exemplification of the present invention.

New obese polypeptide useful for inducing reduction of body weight in an animal, for preparing a composition for treating obssity, disease associated with obesity such as hypertension, heart disease or type II

Example 10; Page 44; 144pp; English.

The invention relates to an obese (ob) polypeptide, also known as leptin, expressed predominantly by adipocytes and capable of inducing reduction of body weight in an animal. The polypeptide is useful for monitoring therapeutic treatment of a disease associated with elevated or decreased levels of ob polypeptide in a mammalian subject; for use in radioimmunoassays for measuring fat and/or plasma levels of ob protein or for detecting the presence and level of receptor for ob on tissues, such as hypothalamus; for screening expression libraries to isolate active receptors; for use in cosmetics by improving body appearance by reducing fat deposits or appetite or both and is used independently or in conjugation with other cosmetic strategies e.g. surgery for its cosmetic

effect; for identifying agonists or antagonists that affect its activity and has potential agricultural uses e.g. increasing the body weight of animals. Nucleic acid encoding the polypeptide is useful for identifying mutation in ob nucleotide, in gene therapy for obesity and in the measurement of its encoded RNA and protein in nutritional disorders. A host cell transfected with a vector expressing the polypeptide is useful in the preparation of modulators of the polypeptide and its nucleic acid. An immunogenic fragment of the polypeptide is useful for preparing an antibody. The antibody is useful for measuring the presence of the polypeptide in a sample to detect or diagnose the presence of a disease associated with elevated or decreased levels of ob polypeptide in a manmalian subject; for imaging ob polypeptide in situation comprising the polypeptide is useful for reducing body weight of an animal, in particular humans. A composition comprising an antagonist of the polypeptide is useful for increasing body weight of an animal, compressing the polypeptide and the antagonist are useful for treating obesity, weight loss associated with cancer or ALDS, disease associated with bossity such as hypertension, heart disease or type II The present sequence represents a human sequence tagged specific PCR primer

The present invention relates to methods and oligonucleotides for forming a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel orientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression is controlled by sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be selected to specifically bind to pathogenic double-stranded DNA including specific sequences required by pathogenic double-stranded DNA including specific sequences required by pathogenic double-stranded DNA including their pathogenicity. Alternatively, the oligonucleotide can be chosen to target a unique sequence of the A triple-helix comprising a double helical nucleic acid (DHNA) and an oligonuclectide which binds in parallel and antiparallel orientation, respectively, for targetting sequences on alternate strands of DHNA to Example 7; Column 41; 108pp; English. control gene expression -

 The invention relates to a method of determining the presence or absence of a CY2D6 target sequence in a DNA sample containing CYP2D6 nucleic acid. Determining the presence or absence of a CY2D50 target sequence in a sample of DNA containing CYP2D6 mucleic acid comprises contacting the nucleic acid with a probe under stringent binding conditions, and detecting the presence or absence of the target sequence bound with the probe with a scattered light detectable particle, by observing light scattered from the particle which indicates the presence or sequence. The method is useful for detecrabing the presence or absence of particular single nucleotide polymorphisms or alleles in genomic nucleic acid, especially in a pharmacogenetically relevant gene or genes in a sample. The method may also be used to detect specific mutations to identify the phenotypic classification of an individual.

The invention describes an OB (obese) polypeptide (also referred as leptin) (1), capable of modulating body weight, comprising amino acids 22 - 167 of a human or mouse OB polypeptide sequence of 167 amino acids (S1), given in the specification, or amino acids 22 - 166 a human or mouse OB polypeptide sequence of 166 amino acids (S2), given in the specification. The OB polypeptide is useful for reducing body weight in conditions of obesity, and as a target for neutralising antibodies associated with cancer, acquired immunodeficiency syndrome (AIDS) or anorexia nervosa. This sequence represents a primer associated with the isolation of the human obese (Ob) or leptin gene.

The invention describes an isolated polypeptide (I) comprising an amino acid sequence which bhares at least 70% or greater than 95% percent cleantity with a fully defined human Zsig24 polypeptide sequence (SI).

The polynucleotide encoding Zsig24 is useful as a diagnosfit reagent for nucleic acid molecules that encode Zsig24 from RNA isolated from a mplifted nucleic acid molecules, where the presence of a mutation in the molecules acid molecules, where the presence of a mutation in the molecules acid molecules, where the presence of a mutation in the indigence of a chromosome II abnormality. The polynucleotide is also useful of diagnosing a metabolic disease (e.g., obesity or diabetes, preferably indianolate) or susceptibility to a metabolic disease in an expression or activity of Zsig24 polypeptide comprising sequence of (SI) conditional. The method optionally involves amplifying nucleic acid molecules that encode Zsig24 from RNA isolated from a biological sample of the individual, and detecting a mutation in the amplified nucleic acid molecules where the presence of a mutation indicates of inclaid and encode Zsig24 from RNA isolated from a biological calcange in the amplified mutation in the amplified nucleic acid molecules where the presence of a mutation in an encode Zsig24 from RNA isolated from a biological sample of the subject, and translating Zsig24 mutation in a new human gene that resides on chromosome 11g22-g24, a conditional to locate the novel human membrane associated protein conditional and the conditional membrane associated protein conditional and a protein conditional and a protein appears that resides on chromosome and a protein and a

This invention relates to a novel method for preventing phagocytosis of immune complexes comprises introducing an inhibitor of a kinase endopenous to phagocytic cells associated with an Fc receptor at the endopenous to the cells under conditions so that the phagocytic potential of the cells is inhibited. The method of the invention may have immunosuppressive, dermatological, antiinflammatory, antiarthritic, antiratheumatic and antiasthmatic activities and may be used as a kinase inhibitor. The method and compositions of the invention may be used for antispens by inhibiting phagocytosis and modulating the interaction of antispens by inhibiting phagocytosis and modulating the interaction of immune complexes with cellular to tissue Fc receptors. The method is used for treating autoimmune diseases, immune mediated diseases e.g. used for treating autoimmune diseases, immune mediated diseases e.g. the within and immune complexes diseases e.g. lupus erythematosus and rhandard arthritis, and for preventing immune complexes deposition in tissues e.g. the kidneys and in the joints. The present sequence represents a human Syk kinase PCR primer used to amplify the Syk

 The invention relates to a cell strain which is derived from rat periodontium and can be maintained in passage. The methods of the invention are useful for acquiring a cell strain, establishing a cell strain, and measuring the bloactivity against the cell of a rat-derived periodontium. The cell strain can be used for treating and preventing tooth diseases such as periodontitis and periodoncosis. This polymucleotide sequence represents a PCR primer used in the exemplification of the invention.
 The present sequence was used in the construction of an expression vector encoding a modified annexin having an N-terminal chelation site, which comprises an amino acid extension including a glycine and a cysteine residue. The modified annexin is useful for imaging vascular thrombi or apoptosis which is associated with response to a chemcherapeutic agent or with rejection as a result of transplantation. The modified annexin can effectively chelate a radionuclide and retain annexin bloactivity. It can be readily prepared in high radiochemical yield and with high radiochemical purity. In contrast to conventional conjugation products, the modified annexin has a single distribution of conjugation products, the modified annexin has a single chelation site remote from the site of biological activity.

PCR primer AAV10121 is used in the amplification of a novel human be steroid receptor, the retinoid receptor protein or RR1. This protein can be used in screening assays for steroid hormone receptor agonists and antagonists and in pharmaceutical compositions for treating adrenal deficiencies, e.g. Addison's disease, cancer, skin disorders, e.g. acne and psoriasts, inflammatory disorders, e.g. arthritis and HIV infections. The protein can also be used for regulating immune responses, e.g. as antitumour agents, vaccine adjuvants, organ rejection inhibitors or agents for treating autoimmune diseases. The protein can further be used agents for treating autoimmune diseases. The protein can further be used

detection of differential gene two differently labeled primers Analysis of RNA samples, useful for

Disclosure; Page 9; 10pp; German.

which comprises amplifying cDNA with first and second differently labeled primers and analysis of the amplified labeled cDNA. The method is useful for analyzing differential gene expression, for identifying and/or characterizing pharmacological activities or for identifying target genes. The use of different primer combinations allow more CDNAs to be amplified. The method also provides a more detailed analysis than prior art methods. This sequence represents a primer used to illustrate the method of the invention.

The present invention relates to a method for haplotyping the human phospholipid transfer protein (PLTP) gene, involving determining the identity of the nucleotide present at one or more of the 25 polymorphic sites within the gene. This can be used to aid drug development for the treatment of diseases associated with different haplotypes of the PLTP gene, possibly including atherosclerosis. The present sequence is an allele-specific probe used for detecting polymorphisms in the PLTP gene. Sequence 15 BP; 6 A; 2 C; 5 G; 1 T; 1 other; Claim 15; Page 13; 98pp; English.

for

WPI; 2002-010724/01.

New isolated polynuclectide which is polymorphic variant of phospholipid transfer protein (PLTP) gene, having any one of polymorphic sites PSI-PS25, for studying function of PLTP, and expressing PLTP protein

Claim 15; Page 70; 99pp; English.

The invention relates to single nucleotide polymorphisms in the gene encoding the human phospholipid transfer protein (PLTF). A method for encoding the human phospholipid transfer protein (PLTF). A method for encoding the PLTF gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the PLTF haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype companies to pairs can be assigned to specific genotypes. An association between a crait and a haplotype or haplotype pair of the haplotype or haplotype pair of the haplotype or haplotype pair in a reference population, where a higher haplotype contaplotype pair in a reference population, the trait is associated with the trait population indicates the trait is associated with the haplotype pair in a reference population indicates the trait is associated with the haplotype or haplotype pair. PLTP and its corresponding DNA are used for candidate drugs to treat diseases related to PLTP activity. The sequences are also useful for studying the effect of variation on the biological activity of ELTP as well as on the binding affinity of candidate drugs targeting PLTP for treating atherosclerosis. Sequences the non-unarranhament and PCR primers used for detecting PLTP gene polymorphisms

Amplifying nucleic acids with base sequences of mRNAs in sample while sustaining the ratio among them used to monitor mRNA expression, applicable in producing e.g. cRNA library and DNA microarrays -

Example 1; Page 53; 67pp; Japanese.

DNA The present invention describes a method of amplifying nucleic acids, involving forming a single-stranded DNA to an mRNA in a sample with a primer, synthesising a DNA strand complementary to the single-stranded DNA to form a double-stranded DNA, adding a single or double-stranded using a single or double-stranded using a second primer with a nucleic acid sequence in the adapter DNA. This can be used to amplify nucleic acid sequence in the adapter DNA, which is applicable in producing e.g. CRNA libraries, CBNA libraries, microarrays or membrane arrays in gene engineering and gene expression analysis, and in drug development and health maintenance and management. The present sequence is a PCR primer described in the exemplification of the invention.

 Anti-gl0 antibody is specific for proteins contg. a gl0 fusion peptide (see AAR51052). However, whereas the gl0 peptide is a useful epitope tag for analysing complexes contg. protein, an RNA epitope tag for analysing complexes contg. protein, an RNA epitope tag would be equally useful for studying complexes contg. NNA. The anti-gl0 serum was presented with a degenerate pool of RNA contg. 1,048,576 species representing all possible RNA species. The transcripts were immunopreoxipitated with the anti-gl0 serum. A single RNA species, Dl0, was obtd. The minimal sequence required for antibody recognition is AAQ45287, in the context of a stem. (Updated on 25-MAR-2003 to correct PN field.)

 Diagnosis and treatment of IL-1 mediated connective tissue diseases - using osteopontin, calnexin, TSG-6 gene prod., genes encoding them
 Gaps
 The present sequence is 1 of 4 degenerate 3' oligo dT primers, which were used along with 25 arbitrary 5' oligodecamer primers for the differential display of human chondrocyte mRNA by reverse transcription and PCR (DDRT-PCR). Sequence analysis revealed the sequences of 52 cDNA clones, which were then searched against DNA databases for homology to known human genes. The cDNA mols. can be used for the produ. of gene specific primers and probes to isolate genes induced by treating (esp. human) chondrocytes with interleukin-lbeta (IL-lbeta), and for the diagnosis of IL-lbeta related connective tissue diseases, in partic. oseteoarthritis or

 This oligo-dT primer was used with a random 10-mer primer (see AAT99553) in an RT-PCR amplification of rat embryo fibroblast REF-112 cell RNA. This was performed in order to identifying p53 regulated genes. One transcript that was upregulated specifically in cells harboring wild-type p53 protein was characterised. A previously known gene, mEH (microsomal epoxide hydrolase), was identified. 2 Novel cell growth regulatory genes, GGR11 (see AAV004008) and CGR19 (see AAV0041009) are called in expensive the genes and the novel CGR11 and CGR19 growth regulatory proteins (see AAV38423 and AAW38425) can be used in methods for the diagnosis and

The present invention describes human senescence factor p23. An expression vector for p23 is useful for inducing a senescent phenotype in a cell (preferably eukaryotic). This may help in regulating diseases, including cancer, persistent inflammation, and various proliferative and degenerative disorders. These transgenic cells are useful in gene therapy for treating cancer, particularly where antisense oligonucleotides are useful for blocking normal or mutant p23 expression in cancer cells or other proliferating cells. Transgenic cells are also useful for raising antiserum against p23, and for antibodies are useful for raising antiserum against p23, and for identifying senescent cells in culture and tissue biopsies. The p23 polymucleotides are useful for modulating or altering p23 activity in a cell, and for identifying and isolating the whole gene encoding p23, cell, and for identifying and isolating the whole gene encoding p23, cell, and for identifying and isolating the whole gene encoding p23, cell, and for identifying and isolating the whole gene encoding p23, cell, and certifying and isolating the whole gene encoding p23, levels and activity are useful as diagnostic markers for staging tumours, determining prognosis, and/or predicting therapeutic success. These
 elements also provide an assay for detecting chromosomal rearrangements in chromosome 3 in a human cell. The isolation of the p33 polynucleotide permits the manipulation of malignant growth in cancer. The present sequence represents a primer used in an example from the present

 PCR primers AAX34947-48 were used to amplify DNA encoding a dehiscence zone protein designated DZ15. The dehiscence zone protein DZ15 and polynucleotide can be used to regulate dehiscence in all crops that lose seed pre-harvest because of cell separation events. The invention especially applies to Brassica napus, but is relevant to plants that develop dry fruits, including Brassica, Synapis, and other genera of the Brassicacee, soybean, and other Leguminous species, Cuphea and
 primer for DNA encoding a dehiscence zone protein designated DZ15.

 The present invention relates to a method for identifying a gene with a selected function comprising contacting genes with a library of ribozymes and identifying at least 1 ribozyme that alters the selected function of the gene. The present sequence is a target sequence used in the present invention. The methods (and ribozymes) are useful for identifying novel genes involved in retinal degradation, retinal disease, learning or memory, amylotropic lateral sollerosis or tumour suppression, and for producing non-human animal models of diseases.

The present invention describes a method for constructing a cDNA tag for identifying an expressed gene. The method comprises: (a) preparation of complementary decoxyribonucleic acid; (b) producing cDNA fragment by cleavage with II type restriction enzyme; (c) obtaining a linker X-CDNA tag. fragment ligated material; (d) amplification of the linker X-CDNA tag. Inker Y ligated material; and (e) cleaving the amplification product. The method can be used for the construction of cDNA tags for identifying expressed genes, which is applicable in gene expression analysis, disease clarification of difference in function or morphology of cells under physiological or pathological conditions. The cDNA or cells for assay can be specifically expressed, with reproducibility and accuracy in the detection of genes. The present sequence represents an expressed gene identification (EGI) cDNA tag related oligonucleotide which is used in
linkers and recognition sequences, applicable in gene expression analysis, disease diagnosis and identifying target for gene therapy
 example from the present invention.

The present invention describes a method for constructing a cDNA tag for identifying an expressed gene. The method comprises: (a) preparation of complementary deoxyribonucleic acid; (b) producing cDNA fragment by cleavage with II type restriction enzyme; (c) obtaining a linker X-CDNA

fragment ligated material; (d) amplification of the linker X-cDNA taglinker Y ligated material; and (e) cleaving the amplification product. The method can be used for the construction of cDNA tags for identifying expressed genes, which is applicable in gene expression analysis, disease diagnosis and identifying target for gene therapy, including the physiological of difference in function or morphology of cells underuplysicological or pathological conditions. The cDNA or cells for assay can be specifically expressed, with reproducibility and accuracy in the detection of genes. The present sequence represents an expressed gene identification (EGI) cDNA tag related oligonucleotide which is used in 886666666666888

Sequential consensus region-directed amplification for sorting mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples, useful for disease diagnosis and gene analysis .

Example, Fig 1E, 19pp, English.

The invention relates to a method of sequential consensus region-directed amplification for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples. The methods, kits and oligonucleotides are useful for sorting a mixture of DNAs into 2 or more subsets or distinguishing sene expression patterns in 2 samples e.g. for disease diagnosis and gene analysis. The present sequence is a PCR primer used to illustrate the method of the invention.

The invention comprises the amino acid and coding sequences of modulator of antigen receptor signalling (MARS) proteins. The MARS protein is a putative tumour suppressor gene and exhibits structural and sequence similarity to the Scr-like adaptor protein (SLAP). The MARS DNA and protein sequences of the invention are useful for the treatment of myeloid malignancies (e.g. acute myelogenous leukaemia) autoimmune disorders, immunosuppression, myeloproliferative disorders and malignancies related to the de-regulation of tyrosine kinases (e.g. breast cancer). The present DNA sequence represents an intron-exon

Retinoid metabolism; retinoic acid; RA; haeme-binding motif; vitamin A; cytochrome P450; prostate cancer; drug screening; PCR primer;
 The present invention relates to retinoid (e.g., retinoic acid (RA), vitamin A) metabolising proteins and nucleic acid sequences encoding them. RA metabolising proteins contain a haeme-binding motif which is characteristic of the group of proteins known as cytochrome P450s. The sequences of the invention are useful in retinoid metabolism and in producing retinoic acid metabolising cytochrome P450s. They are producing retinoic acid metabolising cytochrome P450s. They are producing retinoic acid metabolising cytochrome P450s. They are particularly useful as targets for the treatment of certain cancers such as prostate cancer. The invention also relates to a method of screening drugs for their effect on activity of RA inducible proteins. The present DNA sequence is poly(T) PCR primer which is used for isolating retinoid regulating genes by differential display of mRNAs.

candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, motonic dystrophy, hyperandrogenemia, spihal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTS.

 The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the nucleotide base position indicated in the DE line.

The relA gene product is a subunit of the transcriptional requiator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer and hairpin ribozyme streated against thase mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the carget sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthitis, restenosis and asthma as well as for increasing colerance to transplanted tissues. The potential immunosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo treatment.

A novel method of typing the human leukocyte antigen (HLA) of the major histocompatibility complex (MHC); esp. for typing denors for bone marrow transplants, involves determining if the denor tissue HLA-DR alleles are selected from the gp.: HLA-DRMS2C, DR12a,b, DR3a,n, DR5a-e, DRNew1.
 The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the nucleotide base position indicated in the DE line.

Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin structures and that contain potential bammerhead and hairpin in bozymes cleavage sites were identified by computer analysis.

Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease synthesised with modifications that improve their nuclease thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with renumatoid arthritis, asthma and other inflammatory disorders.

DR6a, DR8a-d, DRW53a-c, DR4a-f, DR7, DR9, DR2a-c B3, DR2a-d B1, DR10 and DR1a-c. The method uses PCR to amplify these regions followed by sequence-specific oligonucleotide probe hybridisation (SSOPH) using the probes AAX79365-X79429. SSOPH allows detection of polymorphisms that predict differences at a single amino acid level thus reducing errors and improving the chance of successfully matching tissues.
 A novel eukaryotic mobile transposon (AAT38932), designated Vader, is present at approx. 15 copies in Aspergillus niger and A. niger var. awamori. It was identified as an insertion in the nitrate reductase gene (niab) gene. 5' and 3' niab sequences flanking the Vader insertion are given in AAT38941 and AAT38942, respectively.

```
The sequences given in AAT41811-20 represent probes which were used to resolve the human leukocyte antigen (HLA) DRB1 alleles, DRB1*08, *12
and *1404. This probe sequence hybridises to the Phe67 coding region found in alleles *0801, *0802,*0804, *0805 and *1202. These probes may be used in the method of invention which concerns HLA typing of a sample for an unknown pair of alleles. The pair of alleles comprises one of two known types which have the same overall set of polymorphisms but the method comprises selectively amplifying the DNA of just one allele of the unknown pair and analysing the amplified DNA to determine which polymorphisms are present in that allele. The method comprises three test stages. The first stage is to establish the number of unknown pair to the known type having that allele. The method comprises three test stages. The first stage is to establish the number of unknown pair to the known type having that allele. The method comprises three test stages. The first stage is to establish the number of alleles present in each sample. Primers corresponding to fairly well conserved regions of a locus will increase the likelihood that unknown alleles will be amplified and potentially detected by hybridisation with a probe. In the second stage, the group or basic type identified and peculially detected by hybridisation with a probe. The group identified in stage one. The second primers comprises an opt. labeled sequence common to each mixture of different labeled primers, complementary to two or more other groups identified in stage one. The second primer may be a mixture of different labeled primers, complementary to two or more other groups identified in stage one. The second primer by detect the presence of a shiple group of alleles. In the third stage the specific allele is determined. This may be done by amplification or hybridisation using a radiolabeled primers between DQB1*100 and DQB1*10001.

Amixture of oligomucleotides (AAT86601-3) were separated by a new process using capillary affinity gel electrophoresis. The invention crelates to selective separation of electrically charged target molecules in an analytical mixture. It comprises capillary affinity gel finity gel electrophoresis using a capillary tube which is at least partly filled with a polymer and electric field of at least 50 voltantly bound to the polymer. An electric field of at least 50 voltacle in a first control of the polymer. An electric field of at least 50 voltacle in a first control of the rarge, the target molecules in the mixture are bound to the separation stage, the target molecules in the mixture are bound to the splitting open. In a second stage, the elution conditions are changed, controlly in stages, so that the affinity of the target molecules for the receptor is eliminated and the target molecules are eluted and detected, optionally whilst splitting open. The process is useful for selective separation and/or determination of charged organic compounds, cut for isolation of specific proteins and DNA molecules, purification of antibitors. The process achieves higher resolution and selectivity than prior at processes, especially in the case of complex biological analytical mixtures. It has high sensitivity, even with small amounts of electric may be expected that may be synthesised specifically when may be expected that may be analytical mixtures. The processes, especially in the case of complex biological electric may be synthesised specifically electric.

Use of isolated gene transcripts - useful for developing products for the diagnosis, prognosis and treatment of cancers, particularly colon and pancreatic cancer differentially expressed in colorectal cancer, in pancreatic cancer, or in both. The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences can be used to identify the tag sequences can also be used in a method color diagnosing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a second sample, where the first sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31815. The methods of the invention can be used in the AAX30947-31815 represent tag sequences of transcripts that are Claim 2; Page 24; 120pp; English.

The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the descriptor line.

The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral ceplication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune diseases, and

Synthesizing branched nucleic acids useful as diagnostic and molecular probes, involves combining first units having haloalkylamino groups and second units having thiol or phosphorothioate groups -

Example 5; Column 17-18; 20pp; English

The present invention relates to a method for synthesising a branched or multiply connected macromolecular structure, comprising oligonucleotide clamps (CO). The macromolecular structure is capable of specifically binding to a target molecule, and can therefore be used as probes. At least one OC comprises a target binding sequence that binds specifically and stably with the target molecule, and at least two OCs comprise signal generation moleties capable of generating a detectable signal in the presence of the target molecule. In addition the OCs are connected to one present sequence is an OC used in the present invention.

gene, New nucleic acid containing polymorphisms in the cyclooxygenase-2 for gene therapy of inflammation and for establishing a genotype of haplotype

Disclosure, Page 23; 118pp; English.

This invention relates to a polymucleotide sequence that is a polymorphic variant of the human prostaglandin-endoperoxide synthase 2 (PTGS2) gene also referred to as cyclooxygenase 2. The human PTGS2 gene sequence AAF80896 contains 27 single nucleotide polymorphisms (SNP9). AAF80896 and protein is represent human PTGS2 gene and coding sequence, and the PTGS2 protein is represented by AAB72199. The invention includes PCR and sequencing primers, and probes represented in AAF80899 and are used to isolated and characterise the PTGS2 gene sequence, and the locate the positions of the SNPs. PTGS2 proteins and polymucleotide 

```
sequences are used to express variant PTGS2 proteins, for structural analysis or drug-binding studies and also in gene therapy (either expressing PTGS2 or inhibitory RNA). Antibodies raised against PTGS2 are useful for diagnosis, prognosis and therapy and analysis of the new, and known, polymorphisms and used to determine PTGS2 haplotype and genotype, especially for determining association between a particular trait, e.g. a clinical response to drugs that target PTGS2 but also disease used for developing diagnostic tests and treatments for immune-related disorders such as arthritis and inflammation. The polymorphisms may also be used to study expression and biological function of PTGS2. Transgenic animals that express PTGS2 are used to study expression of pTGS2.
 effects of therapeutic agents.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [GF9-1] receptor, IGF binding protein [IGF8P]-2 or IGFBP3, which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of portianis, ichthyosis, pityrianis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, bening growths, cancers of the relina, brain or skin, growth factor-mediated malignancies, other scleroderma, in hypernovascular condition such a mediation of the relina, brain or skin, growth factor-mediated malignancies, other scleroderma, warts, hearton of the inside of

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the specification and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatocallular carcinoma. The HCV ribozymes are also useful for treating a condition associated with they infection in conjunction with one or more other drug therapies, particularly type I interferon, sepecially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme.

Identifying cellular regulators essential in pathogenesis of infectious agents, useful for treatment of infectious diseases preferably viral diseases especially hepatitis C virus (HCV)

Claim 16; Fig 4D; 74pp; English

The invention relates to a randomised ribozyme gene vector library which is introduced into a population of cells expressing negative which is introduced into a population of cells expressing negative cell selection marker gene operatively linked to viral mucleic acid acted on by cellular regulator of virus replication or expression cell cell the cellular regulator. Bequenced alpha subunit 1, PMSA1, acting on Hepatitis C virus, HCV, sequenced and a target recognition sequence. Also included are target sequence tags, TST, derived from elf2EBgamma and PMSA1, the ribozyme sequence tags, TST, targetting the TSTS (and a list of target genes given the specification), methods of identifying the ribozyme sequences on the specification), methods of identifying the ribozyme sequences of the methods are useful for identifying a compound that regulator or expression, for identifying a compound that modulates the activity of a viral cellular regulator, identifying a ribozyme reactive with a cellular regulator of virus replication or expression, and for treating an HCV replication. The mid for treating an HCV replication. The ribozymes compounds identified by the above screening methods are used to reduce the severity of such an infection. The ribozymes cond inhibitory compounds identified by the above screening methods are used to reduce the severity of such an infection. The methods are used to reduce the severity of such an infection. The methods are and efficient identification of callular agents involved in the present and efficient identification of elections agents. The present

domain of Gluconbacter oxydans.

The invention relates to a DNA originating in plasmid pF4 with a domain controlling the autonomous replication in Gluconbacter and a domain from which polymucleotides in the region unnecessary in the autonomous replication have been wholly or partly deleted, with exception of the pF4 body. Transformats transformed with the vector can be used to produce physiologically active substances, particularly Leorbose dehydrogenase and/or Leorbose dehydrogenase and 2-keto-L-gulonic acid. The DNAs contain the domain controlling the autonomous replication in a bacterium PCR primer; detection; glaucoma allele; haplotype analysis; human; GLC1B; represents a PCR primer for the the autonomous replication Autonomous replication domain, plasmid pF4; L-sorbosone dehydrogenase; L-sorbose dehydrogenase production; 2-keto-L-gulonic acid; PCR primer; and a domain with polymucleotides in the region unnecessary for this function completely or partially removed to cut down the size, while other domains of the vector can be enlarged by integrating a greater variety of structural genes to impart more functions. Gluconobacter-originated plasmid pF4 DNAs, useful for producing biologically active substance e.g. L-sorbose dehydrogenase and 2-keto-L-gulonic acid PCR primer for G. oxydans autonomous replication domain. chromosome 2; chromosome 6; GLC6p25; haplotype profile; presymptomatic glaucoma; symptomatic glaucoma; ss. This sequence represents a PCR primer used in the method of the invention. The method is for detecting the presence of alleles for glaucoma comprising haplotype analysis of human chromosome 2 and 6 respectively, where the haplotypes are associated with loci GLCIB and GLC6p25 respectively. The primers are used to amplify gene sequences to glocop2 respectively. The primers are used to amplify gene sequences to applotype profiles can be used to detect presymptomatic and symptomatic can be used to detect presymptomatic and symptomatic glaucoma. They can also be used to localise, isolate and identify the canting the haplotype profiles or so that detection of individuals with glaucoma is cantification of mutant alleles in pedigrees or populations. Identification of presymptomatic individuals using the methods allows intervention in the disease process and obviates the impact of inheriting a mutant allele causing disease, by medically disrupting the initiation

Oligonucleotides for human HLA-A and HLA-B subtyping - by reverse transcription, amplification and sequencing

Claim 1; Page 3; 4pp; German.

Raymond V;

Morissette J,

This invention describes a method for the reverse-transcription of human HLA-A and HLA-B RNA and for amplification and sequencing of the resulting cDNA and for HLA-A and HLA-B subtyping by detecting polymorphisms. The invention describes oligonucleotides for reverse transcription, for locus specific PCR and for DNA sequencing.

Detection of chromosome aberrations, used for detecting diseases and disorders, infections, and plant alterations related to e.g. herbicide disorders, resistance

Example 1; Page 44; 63pp; English.

Oligonucleotides AAZ36562-97 represent a set of probes hybridising to the human c-erb-B-2 (HBR-2) gene. The probes are used to demonstrate the human c-erb-B-2 (HBR-2) gene. The probes are used to demonstrate for the detection of chromosome aberrations in eukaryotic samples uses sets of peptide nucleic acid (PNA) probes in hybridisation reactions. The method comprises using at least 2 sets of hybridisation of bybridishing to specific nucleic acid sequences related to a potential of hybridishing to specific nucleic acid sequences related to a potential aberration in a chromosome. The methods can be used for the detection of chromosome aberrations. They can be used for the diagnosis of disorders and diseases related to chromosomal aberrations or abnormalities such as condiseases related to chromosomal aberrations or abnormalities such as the efficiency of and inborn constituted diseases. The method may be used for detecting viral sequences and their localization in the chromosome. In plant biology, the methods can be used for monitoring the efficiency of transferring herbicide resistance genes to a plant.

WPI; 2001-367874/38.

The present invention describes a method for detecting the presence of polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to deter the presence of generic polymorphisms associated with inflammatory bowe disease and correlating their occurrence with disease states. They may used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention.

The sequences given in AAQ47605-11 show regions of homology between used in sequences and the c-jum specific probe C2147 which may be of use as c-jun specific probes. They were used in the method of the invention for the detection and quantification of mRNAs in a sample comprises identifying a polymuclectide sequence unique to the mRNA, and immobilising an oligomer complementary to this sequence to an insoluble support. The sample is then incubated with the insoluble support and be immobilised. Non-immobilised components are washed from the support and bound RNA is labelled in such a way that the unique sequence will hybridise to the bound configurate and be immobilised. Non-immobilised components are washed from the support and bound RNA is labelled in such a way that the label is incorporated onto the support relative to the amount of This method can be used for the raliable, rapid, simultaneous quantification of multiple varieties of mRNA. It may be used for the raliable, rapid, simultaneous states, eg. hereditary diseases, cancer, and infectious diseases of proteins are thought to be involved in causing various disease. States. A genetic deficiency of Gs protein is the molecular basis of hereditary osteodystrophy. Pituteary tumours in acromegalic patients involved in invasive and metastatic melanoma cells, and diabetes. See also AAQ47381-666. (Updated on 25-MAR-2003 to correct PN field.) Sequence 17 BP; 2 A; 7 C; 6 G; 2 T; 0 other; Example 9; Page 72; 177pp; English

Nucleic acid molecule modulating VEGF receptor(s) gene expression or

mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient

Claim 4; Page 116; 218pp; English.

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or receptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAK67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.

Detection and/or genetic analysis of hepatitis B virus - specifically genotype, preCore mutations, vaccine escape mutations and RT gene mutations selected by treatment with drugs

This sequence is a probe for a genotype specific target of hepatitis by virus (HBV). This sequence can be used in the method of the invention for detection and/or generic analysis of hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally releasing, isolating or concentrating polynucleic acids (1) in the sample, and amplifying the relevant part of a mitable HBV gene in the sample with at least suitable primer pair; (b) hybridising (1) with a combination of at least 2 nucleotide probes, which are applied to known locations on a solid support and hybridise specifically to mutant target sequences chosen from

Enzymatic nucleic acids - which cleave RNA derived from an epidermal growth factor receptor, useful for inhibiting cell proliferation and for treating cancers

Claim 5; Page 76; 109pp; English.

The present invention describes enzymatic nucleic acid molecules (NAMS) which specifically cleave RNA derived from an epidermal growth factor receptor (EGF-R) gene. AAV9721 to AAV98043 and AAV98999 to AAV99999 to AAV98899 to AAV98899 to AAV98899 to AAV98866 and AAV98866 and AAV98867 to V9878 represent hammerhead ribozymes and hairpin ribozymes respectively for human EGF-R. The NAMS are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMS can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell.

φ Preparation of antisense oligo:nucleotide(s) which lack long runs consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate growth of cells in culture

Example 4; Fig 6d; 286pp; English.

AAV48709-886 represent antisense oligonucleotides directed against the ErbB-2 gene. Of these, only oligonucleotides AAV48709-91 resulted in significant reduction in ErbB-2 protein expression, while colligonucleotides AAV48792-886 had little effect. The oligonucleotides explain a contain B = 30 nucleotides, which contain at most 8 nucleotides that contain B = 30 nucleotides, which contain at most 8 nucleotides that consecutive nucleotides able to form three H-bonds each to four consecutive cytosines; do not contain two sequences of three consecutive nucleotides each able to form three H-bonds each to four consecutive cytosines, and the ratio between residues able to form two H-bonds each cytosines, and the ratio between residues able to form two C (ZR) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The coligonucleotides are used to modulate expression of genes, particularly coligonucleotides are used to modulate expression of genes, particularly coligonucleotides can also be used to analyse function of prinary call cultures (e.g. bone marrow stem, liver or oligonucleotides can also be used to analyse function of proteins (by cases of cancer or (targeting TGP) for stimulating the immune system.

```
A method has been developed for the identification of a nucleic acid capable of modulating a process in a biological system. The method comparises: (a) introducing into the system a random library of nucleic conficience, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence at least part of the SBDs in such systems. Nucleic acid molecules with endonuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian system; oncleaves caused by specific RNA, e.g. cancer, infimamation, systemic diseases caused by specific RNA, e.g. cancer, infimamation, psoriasis, non-hegatic ascites and infection. They may also be used to caref genetic drift and mutations in diseased cells and to determine carefully NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of craf. Introduction of sugar/phosphate modifications represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene.
 Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restenosis, and also new ribozymes and modified nucleoside triphosphates used as antiviral agents and synthons

The mention was been developed to the international or a nucleic acid capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic card catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (D) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endonuclease activity and catalytic activity, from the present calls and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, specifically and mutations in diseased cells and to determine cystemic diseases caused by specific RNA, e.g. cancer, inflammation, consistent of the Raf gene, are used to cheek cancer, inflammation, consistent carlinations in diseased cells and to determine consistent of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated increases stability against nuclease and activity. ANA90922 to AAV93877 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene.
 A method has been developed for the identification of a nucleic acid

A composition for stimulating protection against infection by a pathogen, comprises a live commensal oral organism genetically modified to express cultiple immunogenic fragments of the pathogen. The composition has antibacterial and antiviral activity and acts as a vaccine. The composition which is administered orally or intransally, is used for prophylactically treating a host against infection by a pathogen such as Bordetella pertussis, respiratory syncytial virus, poliovirus, Mycoplasma or Bordetella pertussis, respiratory syncytial virus, poliovirus, Mycoplasma or premingococcus, pneumococcus, rotavirus, influenza, copymeabacterium diphtheriae, Clostridium tetani, hepatitis or baring preminde, Chlamydia trachomatis, Moraxella catarihalis, or their combinations. The composition can also be used for chronic munuisation of a host against infection by a pathogen. The present communication of a host against infection by a pathogen. The present communication which is used in an example illustrating the use of the

Nucleic acids encoding interphotoreceptor matrix proteoglycans useful for preventing, diagnosing and treating ocular disorders such as retinal detachment and chorioretinal degeneration -

Claim 43; Page 44; 183pp; English

per primers AAA46209-42 were used to amplify cDNA encoding an interphotoreceptor matrix (IPM) proteoglycan, designated IPMISO. The protein is an IPM component (IPMC). Two subfamilies of IPMCS, IPMISO and IPM200, exist. The human IPMISO gene is located on chromosome (eq13-q15, between markers CHIC.GATANIFIO and D6S284. The IPM proteins may be used to supplement a patients own production of the protein or to rectify alterations in their nucleic acids that result in corporations in their nucleic acids that result in this way to treat coular diseases such as retinal detachment, chorioretinal degeneration, retinal degeneration, age related macular degeneration, photoreceptor degeneration, RPE (retinal pigment copering) degeneration, cone degeneration, mucopolysaccharidosis, rod-cone dystrophy and cone-rod dystrophy. The nucleic acids and proteins may also be used to assay for other modulators of IPM proteoglycan expression and activity that may be used to treat ocular diseases. The nucleic acids and proteins may also be used as diagnostic reagents to detect the presence of IPM nucleic acids and their products in samples from patients according to standard methodologies.

 A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention. AAA35948
 Detection of single nucleotide polymorphisms in genomes by preparation and analysis of reduced complexity genomes, useful for genotyping, fingerprinting and determining allele frequency of SNPs

This invention describes a novel diagnostic test to diagnose arteriosclerosis and its complications, for cardiovascular risk factors and rheumatic diseases, especially soft rheumatism, comprising characterizing the GAA-repeats of the frataxin gene. The risks and complications of arteriosclerosis are 5-times higher in diabetics than non-diabetics. The diagnostic test is used to predict cardiovascular risk factors and their complications for example in diabetes mellitus type 2 (Non-insulin dependent diabetes mellitus, NIDDM). This sequence represents a PCR primer used in the amplification of the frataxin gene which is used in the method of the invention.

The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chkl) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chkl levels, including cancer. The present sequence is an oligonucleotide described in
 The present invention describes a method for predicting the potential of an oligomucleotide to hybridise to a (complementary) target nucleotide sequence, involving identifying a subset of oligomucleotides within the predetermined number of unique oligomucleotides based on the evaluation of the parameter. Oligonucleotides in the subset are identified that are clustered along a region of the nucleotide sequence that is hybridisable to the target nucleotide sequence. This is useful for evaluating oligonucleotide probe sequences. The present sequence is an oligonucleotide described in the exemplification of the invention.
 Predicting the potential of an oligonucleotide to hybridize to a target nucleotide sequence, useful for evaluating oligonucleotide probe sequences, by identifying a oligonucleotides based on the evaluation of parameters

The present invention describes an isolated nucleic acid (1) encoding a human UDP-GalNAc.polypeptide N-acetylgalactosaminyltransferase 10 (pp-GaNTase 10, EC 2.4.1.41) protein. Human pp-GaNTase 10 is located to chromosome 7q11.2. (1) can be used in gene therapy. Molecules of the present invention can be used in therapy, particularly to prevent or pp-GaNTase. The sequences given in ABVBSG11 to ABVBSG89 and ABPSE302 to ABPSE3304 are given in the exemplification of the present invention. N.B. The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied by the

The present invention relates to methods and compositions useful for detecting mutations which cause Familial Dysautonomia (FD, Riley-Day Syndrome, Heredditary Sensory and Autonomic Neuropathy Type III) [OMIM 223900]. It was found that mutations in the IKBKAP gene (see ABQ80565) are associated with FD. The mutation associated with the major haplotype of FD, FDI mutation, is a base pair (bp) mutation, where the thymine conclected at pp 6 of introm 20 in the IKBKAP gene is replaced with a cytosine. This results in skipping of exon 20 in the mRNA from FD extents, although they continue to express varying levels of wild-type conclectide at bp 2397 (bp 73 of exon 19) is replaced with the minor haplotype, FD2 mutation, is a bp mutation, where the guanine conclectide at bp 2397 (bp 73 of exon 19) is replaced with a cytosine. This bp mutation causes an arginine to proline missense mutation (R696P) in the IKBKAP protein, which is predicted to disrupt a potential consister that FDB and for rapid carrier screening. The IKBKAP concluded the FD was created in an example from the invention. Expression of murine Ikbkap was examined cusing port mouse embryor and adult mouse maltiple tissue Northern blots. The blots were probes with a 1045bp PCR fragent that contains exons the blots were probes with a 1045bp PCR framers ABQ80564.

The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (CDD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetyloysteine and mucokinetic agents. The mucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an

 The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The chGDMLP-1 mucleic acids in samples, as amplification and quantify hGDMLP-1 mucleic acids in samples, as amplification or hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific concentration and/or amount specifically of hGDMLP proteins, as specific concentration, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in no particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the invantion.
 N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification customaterates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise COMPMLP-1 proteins, as standards in assays used to determine the COMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific concentration, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement configuration, as the polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders and hGDMLP-1, in commons of the horman in the contract and object the present sequence in hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the contract.
 screening of the hGDMLP-1 sequence in the exemplification of the present

New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1

Disclosure; SEQ ID 8106; 214pp; English.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of brotein 1 (hGDMLP-1) and be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids an be used as probes to detect, characterise and quantify hGDMLP-1 mucleic acids in samples, as amplification of hGDMLP-1 protein variants having desired phenotypic improvements, and of rexpressing the proteins. The hGDMLP-1 proteins as tendenced to determine the hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP-1 proteins, as specific biomolecule capture probes for surface-enhanced laser desorption consistion, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in concentrating of the hGDMLP-1 sequence in the exemplification of the present nvention.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequence.

Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome

Claim 4; Page 62; 149pp; English

Page 743

Thu Jan

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcona, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vugaris, angiofibroma of tuberous sclerosis, port wine stains, Sturge weber syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for creating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of the treatment. Leukaemia or tumour conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a coll.) by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent of diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion genes. ABK/1354-ABK22719 represent nucleic acid colds, including antisense and cargated profession of ERG, and expression of ERG, and expression of ERG, and cargated profession colds, including antisense and cargated profession colds.

Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber

Claim 4; Page 65; 149pp; English

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, vertuca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge Neber syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies the treatment of the patient with (I) to the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a coll, by contacting (I) with RNA, in the presence of a dividing cation such as Mg2+. (I) is useful for diagnosis of conditions and classases related to the expression of ERG, and as diagnosis to tool to examine genetic drift and mutations within diseased cells or tool ecct the presence of ERG RNA in a cell. (I) is useful for specifically carageing genes that share homology with ERG gene or ERG fusion genes.

ABRIA7354-ABRA2719 represent nucleic acids, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, and expression of ERG, and enzymatic nucleic acid molecules acids, including antisense and enzymatic nucleic acid molecules acids including antisense and enzymatic nucleic acid enzymation.

RESULT 1663 ABT34415 à Д

The invention relates to an oligonucleotide for targeted alteration of a genetic sequence, which comprises a single-stranded oligonucleotide having a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modifications of the oligonucleotide. The chemical modifications of the oligonucleotide. The chemical modifications of more phosphorothicate linkages on a terminus, or a combination of any two or more phosphorothicate linkages on a terminus, or a combination of any two or more of these modifications. The oligonucleotides are useful for consist of these modifications of plant genetic information. The oligonucleotides are particularly useful for creating plants with desired phonotypes, e.g. environmental or abiotic stress tolerance, improved conferring amino acid over production, herbicide resistance (e.g. altering amino acid content of plants or conferring amino acid over production, herbicide resistance, of sease resistance, inidazolinone and sulphomylurea herbicide resistance, disease resistance, indazolinone and sulphomylurea production (e.g. increased starch or production of waxy starch), altered floral morphology (e.g. male-sterile plants) or modified fatty acid content (e.g. increased starch or production of waxy starch), altered floral morphology (e.g. male-sterile plants) or modified fatty acid content (e.g. reduced plantleter, increased stearate or reduced linolenic acid). The oligonuclectides are also useful for producing albino mutants for the analysis of photosynthetic processes. This sequence represents a genome of altering oligonuclectide of the invention. New oligonucleotides with modified nuclease-resistant termini, usef for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil production -Claim 7; Page 137; 220pp; English.

New isolated nucleic acid, useful for treating viral diseases

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 ł identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated mucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the nucleic acids, cells containing the nucleic or or antibodise directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell diseases that an entained for disagnosis and/or prognosis of these schools and patient samples is useful for disquosis and/or prognosis of these dotter the polypeptides can also be used to generate antibodies, and contain the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression. associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells Disclosure; Page 40; 720pp; French.
